1 Introduction

This *Final First Phase Pre-Design Investigation Data Summary Report and Second Phase Pre-Design Investigation Work Plan* (Combined DSR-PDIWP) summarizes the results of the first phase pre-design investigation (PDI) for the US Moorings Project Area (Project Area), located between approximately the downstream end of the St. Johns Bridge and river mile (RM) 6.1 on the west side of the Willamette River, and bounded on the upstream side by the Gasco Sediments Site Project Area, the channelward side by the B1 Navigation Channel Project Area, and the downstream side by the B1a Project Area (Figure 1-1). This Combined DSR-PDIWP has been prepared under the *Administrative Settlement Agreement and Order on Consent for Removal Action* (AOC; CERCLA Docket No. 10-2009-0255), the *AOC Amendment No. 2 for Remedial Design at B1 Navigation Channel Project Area and U.S. Moorings Project Area*, and the *Remedial Design Statement of Work, Portland Harbor Superfund Site, U.S. Moorings Project Area* (SOW; EPA 2020a) executed between NW Natural and the U.S. Environmental Protection Agency (EPA). This Combined DSR-PDIWP addresses EPA's comments dated July 21, 2022, and February 22, 2023, on the draft and revised versions of the Combined DSR-PDIWP dated May 27 and November 30, 2022, respectively. Responses to EPA's comments are provided in Appendix J. In addition, this Combined DSR-PDIWP addresses EPA comments dated September 19, 2022, pertaining to the expedited conditional approval of the groundwater seepage meter deployment scope of work contained herein. EPA's conditional approval letter and follow-up correspondence between EPA and Anchor QEA (on behalf of NW Natural) are included in Appendix J.

The EPA-approved *Revised Final Pre-Design Investigation Work Plan* (PDIWP; Anchor QEA 2020a) presents the rationale, approach, and methods for completing all aspects of the first phase PDI. Any deviations made to the PDIWP were submitted to and approved by EPA in Field Change Requests (FCRs), as summarized in Section 2 and Table 1-1 and provided in full in Appendix A. The first phase PDI results are presented and evaluated in this Combined DSR-PDIWP and used to support the design of the proposed second phase PDI to complete any outstanding Sediment Management Area (SMA) and Conceptual Site Model (CSM) Refinement Objectives and to address the Remedial Technology Refinement Objective. The combined first and second phase results will be used to develop the Basis of Design Report (BODR) and subsequent Remedial Design Work Plan (RD Work Plan) required by the SOW.

1.1 Purpose and Objectives

Consistent with the SOW, the purpose of the PDI is to identify and address data gaps by conducting field investigations needed to develop the BODR and RD Work Plan for the following three specific refinement objectives identified:

1. SMA Refinement Objective

2. CSM Refinement Objective
3. Remedial Technology Refinement Objective

Because of the limited amount of data available within the Project Area when the *Record of Decision – Portland Harbor Superfund Site, Portland, Oregon* (ROD; EPA 2017) was issued, the PDI is being implemented in two phases. The first phase was completed in 2021 and informs the first two objectives (SMA Refinement and CSM Refinement). Based on the first phase findings presented herein, the second phase has been designed to complete any outstanding SMA and CSM refinements and to address the Remedial Technology Refinement Objective.

The results from the first phase PDI data collection, presented in this Combined DSR-PDIWP, provide the data necessary to refine SMAs and the CSM and provide information necessary for upcoming remedial design (RD) data requirements. These data are used to support the RD data gaps evaluation for the second phase PDI presented in Section 5.

Consistent with the SOW, this Combined DSR-PDIWP presents the following:

- Summary of the investigations performed (i.e., the PDI)
- Summary of investigation results
- Summary of validated data (i.e., tables and graphics)
- Laboratory data reports and data validation reports
- Narrative interpretation of data and results
- Photographs documenting the work conducted
- Next steps to complete the second phase PDI

Statistical and modeling analyses, as described in SOW Section 3.2(b)(6), are not applicable for this report and are, therefore, not included herein.

1.2 Document Organization

The remainder of this document is organized into the following sections:

- Section 2 – First Phase Pre-Remedial Design Investigation Overview
- Section 3 – First Phase Chemical and Physical Data Quality
- Section 4 – First Phase Chemical and Physical Analytical Test Results
- Section 5 – Second Phase Pre-Design Investigation Work Plan
- Section 6 – Schedule and Reporting
- Section 7 – References

The following appendices are attached to this document:

- Appendix A – Field Change Requests
- Appendix B – Field Sampling Collection Forms and Logs

- Appendix C – Field Photographs
- Appendix D – Field Daily Reports
- Appendix E – Laboratory Data Reports
- Appendix F – Data Validation Reports
- Appendix G – Second Phase Pre-Design Investigation Field Sampling Plan
- Appendix H – Second Phase Pre-Design Investigation Quality Assurance Project Plan
- Appendix I – Seepage Meter Deployment Supplemental Information
- Appendix J – NW Natural Response to EPA’s July 21, 2022, and February 22, 2023 Comments on the Draft and Revised Combined DSR-PDIWP
- Appendix K – Fall Seepage Meter Deployment Expedited Conditional Approval
- Appendix L – Shoreline Habitat Assessment

2 First Phase Pre-Remedial Design Investigation Overview

This section provides an overview of the first phase PDI conducted at the Project Area from October 2020 through May 2021. The sampling activities described in this section were performed to fill the data gaps identified in the PDIWP (Anchor QEA 2020a) using methodologies discussed in the *Revised Final Field Sampling Plan* (First Phase FSP; Anchor QEA 2020b). The PDI scope of work was completed in its entirety, with all refinements documented in the EPA-approved FCRs summarized in Table 1-1 and provided in Appendix A.

This section discusses the number and type of samples collected, the analyses that were conducted, and the details of the sampling methodologies used to complete the PDI. Summaries of each PDI sampling program are presented in Tables 2-1 through 2-4. Locations for each sample are presented in Figures 2-1, 2-2, and 2-3.

Quality control (QC) measures implemented during PDI data collection efforts are summarized in Section 3 consistent with the *Revised Final Quality Assurance Project Plan* (First Phase QAPP; Anchor QEA 2020c), and observations and chemical and physical analytical test results are presented in Section 4.

Field sampling collection forms and processing logs are presented in Appendix B, field photographs are presented in Appendix C, and field daily reports submitted to EPA during the PDI are presented in Appendix D.

2.1 Surface Sediment Sampling

Surface sediment grab samples were collected from the 0- to 1-foot-below-mudline (bml) interval consistent with methods described in the First Phase FSP (Anchor QEA 2020b) to address the data gaps and temporal relevancy requirements identified in Section 3.5 of the PDIWP (Anchor QEA 2020a) for the SMA Refinement and CSM Refinement Objectives.

2.1.1 SMA Refinement, Data Density, and Temporal Relevance Within the Project Area

As identified in the First Phase FSP (Anchor QEA 2020b), surface grabs were collected to refine the SMAs within the Project Area (Figure 2-1) using a three-point composite approach via hydraulic power grab deployed from a sampling vessel. These samples were analyzed for total solids (TS), total organic carbon (TOC), the “focused contaminants of concern” (COCs) and “additional contaminants” included in ROD Table 21, and geotechnical index parameters. ROD Table 21 establishes remedial action levels (RALs), principal threat waste (PTW)-highly toxic thresholds, and PTW-not reliably contained (NRC) thresholds—collectively referred to herein as RAL and PTW

thresholds.¹ Aside from the items described in the EPA-approved FCRs (Appendix A), there were no deviations during these PDI field sampling activities.

In accordance with Section 6.1 of the PDIWP (Anchor QEA 2020a), NW Natural used the following lines of evidence to identify the EPA-approved surface (0 to 1 foot) sediment grab locations to refine the lateral extents of the SMAs within the Project Area:

- Updated RAL focused COC and PTW-highly toxic threshold natural neighbor exceedance contours using the ROD surface sediment dataset supplemented with the additional collected first phase surface sediment data
- Data density within and immediately adjacent to the Project Area SMAs
- The age (temporal relevance) of closely located surface sediment grabs collected within the Project Area boundary at different times and where there is potential for erosion and/or burial of contaminated surface sediment to alter concentrations, particularly at locations where large concentration changes have been documented

Fifty-five three-point composite surface grab samples were proposed to refine the ROD-identified SMA limits within the Project Area, as shown in Figure 2-1 and summarized in Table 2-1. However, during the field effort, EPA approved removing USMPDI-032 from the PDI sampling program. As described in FCR #4 (Table 1-1; Appendix A), the RD data density data quality objective (DQO) in this area was already achieved. Therefore, 54 three-point composite surface grab samples were collected during the first phase PDI.

The bulk surface sediment results are summarized in Section 4.1.

2.2 Subsurface Sediment Sampling

As discussed in Section 5.4 of the PDIWP (Anchor QEA 2020a), the first phase PDI included the collection of subsurface sediment data to support delineation of the depth of contamination (DOC; for this project, DOC is defined as the bottom depth of ROD Table 21 RAL, PTW-highly toxic threshold exceedances, and PTW-NAPL² in the bottom sampled interval with two consecutive 1-foot underlying intervals containing no exceedances) and performance of capping demonstrations throughout the SMAs, including any necessary chemical stability evaluations to support buried contamination determinations.³ Consistent with Section 3.4 of the First Phase FSP (Anchor QEA 2020b), 20-foot core tubes were advanced to a maximum depth of 20 feet bml or to refusal in

¹ The ROD RAL and PTW thresholds were updated to include revisions from the ROD *Explanation of Significant Differences – Portland Harbor Superfund Site, Portland, Oregon* (EPA 2019a) and Errata #3, dated September 7, 2022 (EPA 2022b).

² PTW-NAPL has not been observed in any surface or subsurface sediment or riverbank soil samples collected from the Project Area to date.

³ While not explicitly stated in the PDIWP (Anchor QEA 2020a), these first phase subsurface cores can also be used to achieve the buried contamination SMA Refinement Objective in accordance with EPA's Buried Contamination Guidance (EPA 2022a). See Section 5.1.2 for additional information.

intermediate⁴ and future maintenance dredging (FMD) regions (site regions are identified in ROD Figure 18) and to 16 feet bml or to refusal in the shallow⁵ region using a vibrocore deployed from a vessel using a core recovery acceptability criterion of 75%. As described in FCR #4 (Table 1-1; Appendix A), four cores located in the shallow region (USMPDI 028, USMPDI-030, USMPDI-031, and USMPDI-035) used an 8-foot coring assembly approved by EPA due to shallow refusal and insufficient river water surface elevations to collect the proposed 16-foot cores. Each core was visually logged for the potential presence of PTW-nonaqueous phase liquid (NAPL) throughout the full penetration depth, as described in the SOW (EPA 2020a).

2.2.1 *Subsurface Sediment DOC*

Subsurface sediment cores were collected throughout the entire Project Area at less than 150-foot data density and analyzed consistent with Section 3.4 of the First Phase FSP (Anchor QEA 2020b) such that the DOC could be determined at each subsurface sediment sampling location. NW Natural used the following lines of evidence to assess the surface sediment defined boundaries of the Project Area and to identify the EPA-approved locations to refine the Project Area and inform the DOC:

- The presence, if any, of subsurface sediment ROD Table 21 RALs and PTW-highly toxic threshold exceedances within the Project Area that do not have co-located surface sediment exceedances but have the potential for future exposure based on chemical and physical characteristics
- Data density throughout the Project Area necessary to proceed with RD

Based on these lines of evidence, fifty-seven sediment cores were proposed to confirm or refine the current DOC within the Project Area as depicted in Figure 2-2. Fifty-five of these locations were co-located with surface grab samples; two locations with existing Pre-RD Group surface data did not require surface grabs. As described in FCR #4 (Table 1-1; Appendix A), USMPDI-032 was removed from the PDI sampling program due to the RD data density DQO in this area already being achieved. Therefore, 56 subsurface sediment core locations were sampled during the first phase PDI. All DOC cores were analyzed for the analytes presented in Tables B5-1 and B5-2 of the First Phase FSP (Anchor QEA 2020b). However, as described in FCR #1 (Table 1-1; Appendix A), adjustments were made to include alkylated polycyclic aromatic hydrocarbons (PAHs) and total petroleum hydrocarbon sampling intervals so they would be co-located with capping evaluation sample intervals at six core locations.

⁴ The intermediate region is defined in Section 14.2.3 of the ROD as "outside the horizontal limits of the navigation channel and FMD areas to the riverbed elevation of approximately -2 ft CRD [+1.1 ft COP]."

⁵ The shallow region is defined in Section 14.2.4 of the ROD as "shoreward of the riverbed elevation of approximately -2 ft CRD [+1.1 ft COP]."

2.2.2 *Subsurface Bulk Sediment Sampling to Support Capping Demonstrations*

As stated in Section 6.2.2. of the PDIWP (Anchor QEA 2020a), the sampling objective for bulk subsurface sediment samples is to measure bulk sediment concentrations approximately 4 feet below a potential future pre-cap surface elevation. Therefore, bulk subsurface sediment samples were collected from each of the proposed DOC cores discussed in Section 2.2.1. Bulk sediment samples were submitted for chemical analyses and used to support evaluation of capping viability based on application of the ROD Figure 28 technology application decision tree. Cores collected from each region of the Project Area were sampled to obtain bulk sediment data for the preliminary capping evaluations as follows:

- **Within the Navigation Channel:** NW Natural collected two cores within the navigation channel adjacent to the Project Area. These cores were subsampled in successive 2-foot sediment composite intervals starting at -47 feet City of Portland datum and continuing to the full core recovery depth.
- **Outside the Navigation Channel in the FMD Areas and Intermediate Region:** NW Natural collected 38 cores throughout the Project Area within the intermediate region. Each core was subsampled in successive 2-foot composite sediment intervals starting at the existing mudline and continuing to the full core recovery depth.
- **Outside the Navigation Channel in the Shallow Region:** NW Natural collected 17 cores throughout the Project Area within the ROD-identified shallow region. As discussed in FCR #4 (Table 1-1; Appendix A), USMPDI-032 was removed from the PDI sampling program due to the RD data density DQO in this area already being achieved. Therefore, 16 cores were collected in this region during the first phase PDI. Consistent with the first phase PDI, each core was subsampled in the following successive intervals: 0 to 2 feet, 2 to 5 feet, 5 to 7 feet, 7 to 10 feet, and 10 to 13 feet.

Composite bulk sediment samples from each region of the Project Area (i.e., navigation channel, FMD areas, intermediate region, or shallow region) were submitted for chemical analysis as discussed in Section 6.2.2 of the PDIWP (Anchor QEA 2020a). A single archive sample was collected from each core interval that does not overlap with the DOC objective sample intervals.

The subsurface sediment results are provided in Section 4.2.

2.3 **Riverbank Surface Soil and Angled Boring Subsurface Soil Sampling**

As discussed in Section 5.4 of the PDIWP (Anchor QEA 2020a), to inform remedial technology refinement along the riverbank, angled borings were advanced from the top of riverbank under the existing riverbank surface. At each angled riverbank boring location, surface soil samples (riverbank soil samples for erodibility testing) were collected, and subsurface soil samples were collected to

characterize the wedge of riverbank soil material between the toe of slope and the top of the riverbank.

Riverbank surface and subsurface soil samples were collected for additional information to inform the following RD evaluations:

- Estimated vertical and lateral extents of PTW-NAPL, and RAL, PTW-highly toxic, and ROD Table 17 riverbank soil/sediment cleanup level (CUL) exceedances in the riverbank
- Lateral extent of the riverbank that passes the erosion evaluation identified in the ROD technology application decision tree (Appendix A of the PDIWP [Anchor QEA 2020a])
- Evaluation of applicable remediation technologies based on erosion and presence of contamination
- Bulk sediment data to support the riverbank capping demonstration

2.3.1 Riverbank Surface Soil

As discussed in Section 6.3 of the PDIWP (Anchor QEA 2020a), 13 surface soil sample locations were proposed for collection on approximately 150-foot horizontal spacing across the Project Area uplands immediately adjacent to the river. As verbally agreed with EPA oversight personnel during visual reconnaissance of the riverbank and described in EPA-approved FCR #3 (Table 1-1; Appendix A), all riverbank surface soil locations other than USMPDI-073 and USMPDI-077 were abandoned due to lack of surface erodible soils. Therefore, only 2 of the 13 proposed surface soil sample locations were collected.

Each of the 2 surface grab sample locations was collected as a two-point composite sample from 0 to 1 foot below ground surface, consistent with FCR #3 (Table 1-1; Appendix A) and the methodologies described in the First Phase FSP (Anchor QEA 2020b). The grab samples were submitted for chemical analysis, as discussed in Section 6.3 of the PDIWP (Anchor QEA 2020a). As discussed in FCR #3, limited surface soils were present at USMPDI-073 and USMPDI-077 limiting the amount of available sample volume. Therefore, chemical analyses were prioritized over geotechnical index parameter analyses at these locations.

2.3.2 Riverbank Angled Borings

As discussed in Section 6.4 of the PDIWP (Anchor QEA 2020a), 13 riverbank angled boring locations (riverbank soil samples for erodibility testing) were proposed based on approximately 150-foot horizontal spacing across the Project Area uplands immediately adjacent to the river. As discussed in FCR #2 (Table 1-1; Appendix A), riverbank angled boring locations USMPDI-065 and USMPDI-070 were abandoned from the PDI sampling program due to the presence of utilities and a timber bulkhead wall resulting in boring separation much closer than the proposed 150 feet. Therefore, 11 riverbank angled boring locations were collected during the first phase PDI.

Each boring was advanced at an angle toward the river from the top of the riverbank to access subsurface riverbank soils that were inaccessible directly from the surface due to heavy armoring, dense vegetation in some areas, and a steep slope. Bottom depths of each boring were at least as deep as the mudline elevation of the closest downgradient existing or proposed sediment core location. Target locations were adjusted based on contractor access. The drill rig was set up so the core barrel entered the ground at an angle approximating the angle of the riverbank slope, but no shallower than 45 degrees and no steeper than 90 degrees. Boring angles were confirmed in the field using an inclinometer and are included on the boring logs.

Consistent with Section 6.4 of the PDIWP (Anchor QEA 2020a), continuous soil samples were obtained and sampled from 0 to 10 feet, 10 to 20 feet, and 20 feet to the elevation of the nearest offshore sediment core location. Accounting for the angled boring, the target bottom depth interval was calculated as the vertical distance from the ground surface if the core barrel was oriented perpendicular to the ground surface. Riverbank angled boring samples were submitted for chemical analysis, as discussed in Section 6.2.2 of the PDIWP.

3 First Phase Chemical and Physical Data Quality

The data quality assurance (QA)/QC program for the Project Area was performed consistent with the First Phase QAPP (Anchor QEA 2020c). The data QC criteria were met with some limited exceptions. Most data (greater than 99% of the total) are acceptable for use as reported or as qualified, and 21 results (out of 68,296 total results) were rejected due to very low or no recoveries in the surrogate, laboratory control sample (LCS), or matrix spike (MS)/matrix spike duplicate (MSD). Measures were taken to ensure data quality employed current EPA, Standard Method, and ASTM International (ASTM 2010) protocols. Specific actions included field QA/QC, chain-of-custody procedures, and laboratory data review and validation. Chain of-custody forms and laboratory reports are included in Appendix E. Appendix F provides the data validation reports.

3.1 Testing Laboratories and Methods

Chemical and physical analytical testing was performed by Alpha Analytical; ALS Environmental; Apex Laboratories, LLC; Analytical Resources, Inc.; SGS North America Inc.; and Vista Analytical Laboratory. Geotechnical testing was performed by GeoTesting Express.

3.2 Data Quality Objectives

DQOs for this project were to develop and implement procedures that would ensure the collection of representative data of known, acceptable, and defensible quality to achieve project objectives listed in the PDIWP (Anchor QEA 2020a). The analytical testing suite included the parameters listed in Tables C-2 through C-6 of the First Phase QAPP (Anchor QEA 2020c), and DQOs were assessed by the parameters detailed in Section 3.4 of the First Phase QAPP and by applying the precision, accuracy, and completeness control limits in First Phase QAPP Table C-8 to the data during validation.

3.3 Quality Assurance/Quality Control

This section describes the laboratory and field QC procedures that were performed consistent with the First Phase QAPP (Anchor QEA 2020c) to ensure data are of known and acceptable precision and accuracy to achieve project objectives. These procedures included analytical and field QC requirements.

3.3.1 *Field Quality Assurance/Quality Control*

Field QC samples included equipment rinsate blanks and field duplicates that were analyzed to identify field sample heterogeneity and cross-contamination issues, resulting from sample collection or sample processing in the field. All field QC samples were documented on the field forms and verified by the Project QA Manager or designee.

3.3.1.1 Field Blanks

One equipment rinsate blank was collected for each type of sampling technique used to evaluate the cleanliness of the sample containers and efficiency of field decontamination procedures. Rinsate blanks were collected by rinsing deionized water through the water sample collection equipment and over the sediment grab and coring homogenization equipment after standard decontamination procedures were performed consistent with Section 4.3 of the First Phase FSP (Anchor QEA 2020b). Pre-prepared trip blanks were provided by the laboratory. No field blanks were collected for surface sediment grabs during the fall 2020 sampling event due to an oversight by the field team. However, field blanks were collected during the subsurface sediment and surface and subsurface riverbank soil sampling and during the 2021 surface sediment sampling, and the results demonstrated that sample containers provided by the laboratory and used for the first phase PDI were acceptable. The rinsate blanks were collected in appropriate containers for the required analyses. Most rinsate blank results were below detection with the exceptions of some low-level detections in the metals, PAH, volatile organic compound (VOC), polychlorinated biphenyl (PCB) congener, dioxin/furan, and pesticides analyses. Most detected concentrations were between the method detection limit (MDL) and the reporting limit (RL) and much lower than detected sample concentrations. Because detections were infrequent and concentrations were low, decontamination procedures were determined to be adequate, and no data were qualified due to field blank detections.

3.3.1.2 Field Duplicates

Field duplicates were collected at greater than the required frequency of one per twenty samples for surface sediment, riverbank surface soil samples, and riverbank subsurface soil samples. Field duplicates were collected at the required frequency for subsurface sediment samples that were initially submitted for analyses. However, the overall frequency is slightly below the required frequency because field duplicates could not be submitted for archived subsurface sediment samples that were triggered based on initial subsurface sediment concentration results. The intervals that would be triggered at a later date were unknown at the time of sediment core processing. Field duplicates were processed in the same way as the parent sample and were submitted to the laboratory using the sample nomenclature identified in the First Phase FSP (Anchor QEA 2020b). Duplicate samples were analyzed for the full suite of bulk sediment and water analyses listed in the First Phase QAPP (Anchor QEA 2020c).

3.3.2 *Laboratory Quality Assurance/Quality Control*

In accordance with the First Phase QAPP (Anchor QEA 2020c), laboratory QC samples included method blanks, LCSs and ongoing precision and recovery samples, MSs and MSDs (as applicable to the method), surrogate spikes, internal standards, laboratory duplicates, instrument performance checks, and calibration standards. QC analyses results were evaluated during data validation to determine data quality and apply qualifiers as necessary in the case of QC outliers.

3.3.3 *Data Validation*

All data submitted in this report were validated by Laboratory Data Consultants, Inc., of Carlsbad, California, or by Anchor QEA staff in accordance with Section 5.2 of the First Phase QAPP (Anchor QEA 2020c). Stage 4 validations were conducted on one representative data package from each laboratory, except for the geotechnical laboratory, and Stage 2B validations were conducted on the remaining chemistry data. Stage 1 validations were conducted on geotechnical data. Data validation reports are provided in Appendix F. The data validation followed EPA guidelines, as described in the First Phase QAPP (Anchor QEA 2020c) and the National Functional Guidelines for Data Review (EPA 2020b, 2020c, 2020d).

Data validation verified the accuracy and precision of chemical and physical data collected during this investigation. Data qualifiers assigned as a result of the data validation and their definitions are shown on the analytical results tables. Data may have been qualified as biased or estimated for an analysis based on method or technical criteria. Data qualified with a "J" indicates that the associated numerical value is an estimated concentration of the analyte. Data qualified with a "UJ" indicates the estimated RL below which the analyte was not detected. Rejected data are not usable for any purpose. With few exceptions, data were determined to be usable as reported from the laboratory or as qualified during validation. Twenty-one results were rejected during validation due to very low or no recoveries in the surrogate, LCS, or MS/MSD; data completeness was greater than 99%, and the Project Area-specific goals were met. Details of data qualifications and their reasons are discussed in the following sections.

3.3.3.1 **Documentation, Sample Transport, and Holding Times**

Chain-of-custody forms were used to track sample custody and document the handling and integrity of the samples. Samples were either picked up by the laboratories and relinquished under signature by Anchor QEA staff or were shipped to the laboratories. Documented sample custody was maintained throughout collection and analyses. Sample containers were delivered to the analytical laboratories intact and within the required temperature range (0°C to 6°C for chemistry, ambient for physical) as indicated in the sample receipt confirmation reports (included in the laboratory data reports) and associated data validation reports.

Samples were logged in at the laboratories and then placed in refrigerated storage. Samples collected for archival were stored in frozen storage. Some samples were also frozen to extend hold times, as acceptable. The chain-of-custody forms are included in the laboratory data reports (Appendix E).

Samples were appropriately preserved and were prepared and analyzed within method required holding times, with the following exceptions:

- Twenty-five sediment core samples and one riverbank angled boring sample were extracted past the holding time for herbicides analyses due to extraction errors or QC failures in the initial analyses that required samples to be re-extracted past holding time.
- Some PAH results in two sediment core samples were reported from analyses conducted past the holding time due to dilutions required to quantify results within the calibration range.
- One riverbank angled boring sample was analyzed 1 day past the holding time for cyanide analysis.
- One sediment core sample was analyzed 1 day past the holding time for VOC analysis.
- One sediment core rinse blank sample was extracted 2 days past the holding time for pesticides analysis.

Associated sample results were qualified as estimated ("J" or "UJ"-qualifier). Since data are usable as qualified, data quality objectives were not impacted.

3.3.3.2 Data Quality Parameters

Laboratory data quality is assessed on precision, accuracy, representativeness, comparability, sensitivity, and completeness. Applicable quantitative goals for these data quality parameters are listed in First Phase QAPP Table C-8 (Anchor QEA 2020c). These data quality parameters, as well as other parameters reviewed during data validation, are discussed in the following paragraphs. Specific verification/validation assessments and findings for the laboratory reports as well as qualifiers applied to sample results are described in detail in the data validation reports (Appendix F).

3.3.3.2.1 Calibration

Calibration data were provided in the laboratory reports and reviewed during data validation. Calibration acceptance criteria were met by the laboratories, with some exceptions. These exceptions occurred in analyses that report long lists of analytes, and sporadic outliers are acceptable. These included PAHs, semivolatile organic compounds (SVOCs), VOCs, extractable petroleum hydrocarbons, dioxin/furan, herbicides, and pesticides analyses. Data qualifiers were assigned in instances where calibration criteria were not met, indicating results are estimated.

3.3.3.2.2 Precision

Precision is the measure of variability between individual sample measurements of the same property under similar conditions. Precision was measured using field duplicate, laboratory replicate, MSD, and laboratory control sample duplicate (LCSD) analyses. Difference or relative percent difference (RPD) values for parent and duplicate pairs are presented in the associated laboratory data reports and/or data validation reports in Appendix F.

Laboratory duplicates, LCS/LCSDs, and MS/MSDs were analyzed at the required frequency of one per twenty samples analyzed identified in the First Phase QAPP (Anchor QEA 2020c), and precision goals were met for most analyses. Duplicate paired results that were less than five times the RLs were evaluated by the difference between results because RPD values become exaggerated at levels closer to the RL. If the parent or duplicate result was detected and the corresponding parent or duplicate result was not detected, or if both results were below detection, difference values were not evaluated. Laboratory duplicate results that were outside of project-required control limits were qualified "J" or "UJ" to indicate they are estimated. Field duplicates were screened against an RPD value of 50%. Qualification for field duplicates was at the discretion of the validator, and no data were qualified. No data were rejected for duplicate outliers.

3.3.3.3 Accuracy

Accuracy is a measure of the closeness of an individual measurement to the accepted reference or true value. Accuracy was evaluated by the initial calibration verification samples, continuing calibration verification samples, internal standards, surrogate spikes, MS/MSD, LCS/LCSD, and standard reference material percent recoveries. Conformance to laboratory QC sample frequency requirements, as well as acceptability of QC results for accuracy, was evaluated and considered during data validation. Accuracy goals were met with some exceptions. Qualifiers applied to sample results due to accuracy outliers are presented in associated validation reports. Most results that were qualified due to accuracy outliers were qualified as estimated. Fifteen sediment core cyanide results were rejected due to very low recoveries in associated MS/MSD analyses; cis-decalin and trans-decalin results in one field blank and one rinse blank were rejected due to very low recoveries in the associated LCS; the pentachlorophenol result in one sediment core sample was rejected due to no recoveries in the MS and MSD; and the pentachlorophenol result in one riverbank angled boring sample was rejected due to a very low surrogate recovery.

3.3.3.4 Sensitivity

Analytical sensitivities were determined by conducting MDL studies and were tested by the analyses of method blanks and calibration blanks. Matrix interference and detections in method blanks may elevate the established sensitivity of the analysis. Method blank results were below detection with some exceptions. Associated sample results that were not greater than five times the levels detected in the blanks were qualified as non-detects at the RL or the detected concentration, whichever was greater. Target analytes detected in blanks and summaries of subsequent qualifications applied to sample results are presented in the associated validation reports.

3.3.3.5 Completeness

Completeness is a measure of the amount of data determined to be valid in proportion to the amount of data collected. The DQO for completeness for all components of this project was 95%. Data that are qualified as estimated because QC criteria were not met are considered valid for the

purposes of assessing completeness. Rejected results are not considered valid for the purpose of assessing completeness. Completeness was 100% for all matrices and analyses, except for 21 rejected results in the conventional, PAH, and SVOC data sets. Overall completeness was calculated as greater than 99%; completeness goals were met.

3.3.3.6 Representativeness

Representativeness expresses the degree to which data accurately and precisely represent an environmental condition. Sample collection and handling procedures described in the First Phase FSP (Anchor QEA 2020b) were followed to ensure samples represented field conditions, and samples were analyzed to provide a comprehensive assessment of the known and potential contaminants at the Project Area.

3.3.3.7 Comparability

Comparability expresses the confidence with which one dataset can be evaluated in relation to another dataset. For this program, comparability of data was established by using standard analytical methodologies and reporting formats and through common traceable analytical standards.

4 First Phase Chemical and Physical Analytical Test Results

This section provides a narrative and tabulated summary of data⁶ collected during the first phase PDI, as discussed in Section 2. This section provides a summary of the ranges of results for each refinement objective, and more detailed analytical results and statistics are included in the referenced Section 4 tables. No PTW-NAPL was observed in any first phase PDI sediment or riverbank soil samples (surface and subsurface). Consistent with NW Natural's response to EPA General Comment 6 in the Gasco Sediments Site *Revised Pre-Remedial Design Data Gaps Work Plan* (DGWP; see Appendix K-1 of the DGWP [2019a]), any sheen encountered that does not fit the definition of PTW-NAPL identified in Section 3.1.1 of the DGWP will be addressed consistent with the ROD by comparing the bulk sediment concentrations to the ROD Table 21 RALs and PTW-highly toxic thresholds for total PAH.

4.1 Surface Sediment SMA Refinement, Data Density, and Temporal Relevance Within the Project Area

As described in Section 2.1, 54 three-point composite surface sediment grab samples were collected during the PDI to support SMA refinement, to increase surface sediment data density, and to evaluate temporal relevance of previously collected surface sediment data within the Project Area. Each of these surface sediment grab samples was analyzed for the full suite of COCs with ROD Table 21 RALs and PTW-highly toxic thresholds.

In addition to 54 three-point composite surface sediment grab samples, the 0- to 1-foot surface sediment interval collected from 47 sediment cores (see Section 4.2) was analyzed for alkylated PAHs and total petroleum hydrocarbons. Results from these surface sediment samples (101 total samples for TPAH, cPAH, and naphthalene) are summarized in this section. Consistent with NW Natural's understanding of the approach EPA used to develop SMAs for the ROD, the results for both the three-point composite surface samples and the 0- to 1-foot sediment core samples will be used to develop surface sediment-derived SMAs.

This section presents a summary of the surface sediment data quality collected during the PDI. The surface sediment sampling locations are shown in Figure 2-1.

4.1.1 Comparison to Site-Wide RALs and PTW Thresholds

The following is a summary of the site-wide RAL and PTW threshold exceedances in samples collected as part of the investigation. Tables 4-1a and 4-1b present the analytical results for each sample and a summary of RAL and PTW threshold exceedances, respectively.

⁶ All data management and summing were performed consistent with the 2021 Program Data Management Plan (EPA 2021b).

Conventionals: Grain size analysis performed on 5 surface sediment samples located within the Project Area contained an average of 1.5% gravel, 14% sand, and 85.7% fines. TOC content ranged from 1.1% to 4.3% across 53 samples with an average of 2.65% and median of 2.6%. TS ranged from 32.9% to 62.5% across 75 samples with an average of 44.6% and median of 43.7%.

Total PAHs: 17 of 101 detected results exceeded the site-wide RAL (30,000 micrograms per kilogram [$\mu\text{g}/\text{kg}$]). Total PAH results ranged from 720 to 530,000 $\mu\text{g}/\text{kg}$ with an average of 20,800 $\mu\text{g}/\text{kg}$ and median of 5,040 $\mu\text{g}/\text{kg}$.

Total carcinogenic PAH (cPAH)/benzo(a)pyrene equivalent (BaPEq): None of the 101 detected results exceeded the cPAH/BaPEq toxic equivalence quotient PTW-highly toxic threshold concentration (774,000 $\mu\text{g}/\text{kg}$). The average total cPAH/BaPEq concentration is 2,060 $\mu\text{g}/\text{kg}$, with a median concentration of 585 $\mu\text{g}/\text{kg}$ with individual concentrations ranging from 86 to 47,200 $\mu\text{g}/\text{kg}$.

Pesticides: 1 of the 27 detected results for the total sum of dichlorodiphenyldichloroethane (DDD), total sum of dichlorodiphenyldichloroethylene (DDE), dichlorodiphenyltrichloroethane (DDT) (DDx) exceeded the site-wide RAL (160 $\mu\text{g}/\text{kg}$). Total DDx results ranged from 14.9 to 303 $\mu\text{g}/\text{kg}$ with an average 33.5 $\mu\text{g}/\text{kg}$ and median of 20.7 $\mu\text{g}/\text{kg}$.

Dioxin/Furans⁷:

- 1 of the 26 detected 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD) results exceeded the site-wide RAL (0.0006 $\mu\text{g}/\text{kg}$). TCDD results ranged from 0.0000456 to 0.00135 $\mu\text{g}/\text{kg}$ with an average of 0.000267 $\mu\text{g}/\text{kg}$ and median of 0.000191 $\mu\text{g}/\text{kg}$.
- 6 of the 33 detected 1,2,3,7,8-pentachlorodibenzo-p-dioxin (PeCDD) results exceeded the site-wide RAL (0.0008 $\mu\text{g}/\text{kg}$). PeCDD results ranged from 0.000135 to 0.0071 $\mu\text{g}/\text{kg}$ with an average of 0.000748 $\mu\text{g}/\text{kg}$ and median of 0.000524 $\mu\text{g}/\text{kg}$.
- None of the 50 detected 2,3,4,7,8-pentachlorodibenzofuran (PeCDF) results exceeded the site-wide RAL (0.2 $\mu\text{g}/\text{kg}$) or the PTW-highly toxic threshold concentration (0.2 $\mu\text{g}/\text{kg}$). PeCDF results ranged from 0.00021 to 0.0286 $\mu\text{g}/\text{kg}$ with an average of 0.00546 $\mu\text{g}/\text{kg}$ and median of 0.00282 $\mu\text{g}/\text{kg}$.
- None of the 50 detected 2,3,7,8-tetrachlorodibenzofuran (TCDF) exceeded the PTW-highly toxic threshold concentration (0.6 $\mu\text{g}/\text{kg}$). TCDF results ranged from 0.000289 to 0.0375 $\mu\text{g}/\text{kg}$ with an average of 0.00637 $\mu\text{g}/\text{kg}$ and median of 0.00372 $\mu\text{g}/\text{kg}$.
- None of the 53 detected 1,2,3,4,7,8-hexachlorodibenzofuran (HxCDF) results exceeded the PTW-highly toxic threshold concentration (0.4 $\mu\text{g}/\text{kg}$). HxCDF results ranged from 0.000191 to 0.092 $\mu\text{g}/\text{kg}$ with an average of 0.016 $\mu\text{g}/\text{kg}$ and median of 0.00803 $\mu\text{g}/\text{kg}$.

⁷ As communicated in EPA's email dated October 28, 2022 (EPA 2022c), the remediation thresholds for TCDD and PeCDD are 0.001 and 0.0025 $\mu\text{g}/\text{kg}$, respectively. It is NW Natural's understanding that these remediation thresholds will be used in the BODR to fully delineate SMAs and identify DOC.

Total PCB Congeners: 1 of the 52 detected results exceeded the total PCB congener site-wide RAL (75 µg/kg) and the PTW-highly toxic threshold concentration (200 µg/kg). Total PCB congeners results ranged from 0.665 to 230 µg/kg with an average of 14.5 µg/kg and median of 8.25 µg/kg. One sample (USMPDI-017) was mistakenly submitted for PCB Aroclor analyses. Consistent with EPA's *Remedial Design Guidelines and Considerations* (EPA 2021a), these PCB Aroclors data are usable because they achieve data quality objectives, and the reporting limit is less than 9 µg/kg.

Naphthalene: None of the 94 detected results exceeded the PTW-NRC threshold concentration of 140,000 µg/kg. Naphthalene results ranged from 8.6 to 4,370 µg/kg with an average of 228 µg/kg and median of 60.6 µg/kg.

4.1.2 Comparison to Navigation Channel RALs and PTW Thresholds

The following is a summary of the ROD RAL and PTW threshold exceedances in samples collected as part of the investigation within the navigation channel. Tables 4-2a and 4-2b present the analytical results for each sample and a summary of RAL and PTW threshold exceedances, respectively.

Conventionals: TOC content ranged from 2.7% to 2.8% across 2 samples with an average and median of 2.75%. TS ranged from 35.2% to 38.2% across 2 samples with an average and median of 36.7%.

Total PAHs: None of 4 detected results exceeded the navigation channel RAL (170,000 µg/kg). Total PAH results ranged from 4,300 to 25,000 µg/kg with an average of 15,100 µg/kg and median of 15,700 µg/kg.

Total cPAH/BaPEq: None of the 4 detected results exceeded the cPAH/BaPEq toxic equivalence quotient PTW-highly toxic threshold concentration (774,000 µg/kg). The average total cPAH/BaPEq concentration is 1,890 µg/kg with a median of 1,840 µg/kg with individual concentrations ranging from 534 to 3,300 µg/kg.

Pesticides: None of the detected results for the total sum of DDx exceeded the navigation channel RAL (7,050 µg/kg) or the PTW-highly toxic threshold concentration (650 µg/kg). Total DDD results ranged from 10.8 to 11.9 µg/kg with an average 11.3 µg/kg and median of 11.3 µg/kg. The only total DDE result was 12.9 µg/kg. No total DDT results were detected. Total DDx results ranged from 25.2 to 29.2 µg/kg with an average 27.2 µg/kg and median of 27.2 µg/kg.

Dioxin/Furans:

- None of the 2 detected TCDD, PeCDD, PeCDF, TCDF, and HxCDF results exceeded the navigation channel RALs and PTW-highly toxic thresholds.
- TCDD results ranged from 0.000311 to 0.000312 µg/kg with an average of 0.000311 µg/kg and median of 0.000312 µg/kg.

- PeCDD results ranged from 0.000605 to 0.000735 µg/kg with an average of 0.00067 µg/kg and median of 0.00067 µg/kg.
- PeCDF results ranged from 0.00493 to 0.00635 µg/kg with an average of 0.00564 µg/kg and median of 0.00564 µg/kg.
- TCDF results ranged from 0.00876 to 0.00959 µg/kg with an average of 0.00917 µg/kg and median of 0.00917 µg/kg.
- HxCDF results ranged from 0.0141 to 0.0212 µg/kg with an average of 0.0176 µg/kg and median of 0.0177 µg/kg.

Total PCB Congeners: None of 2 detected results exceeded the total PCB navigation channel RAL (1,000 µg/kg) or the PTW-highly toxic threshold concentration (200 µg/kg). Results ranged from 5.3 to 12 µg/kg with an average of 8.65 µg/kg and median of 8.8 µg/kg.

Naphthalene: None of the 4 detected results exceeded the PTW-NRC threshold concentration of 140,000 µg/kg. Naphthalene results ranged from 47.4 to 698 µg/kg with an average of 263 µg/kg and median of 153 µg/kg.

4.1.3 *Temporal Relevance*

Review of the first phase PDI results did not identify any surface sediment samples within the Project Area that are proposed for replacement due to temporal relevance.

4.2 **Subsurface Sediment Investigation**

As described in Section 2.2, 56 subsurface sediment cores were collected during the first phase PDI to support the determination of DOC and to support capping demonstrations, including any necessary chemical stability evaluations to support buried contamination determinations.⁸ Each of these subsurface sediment samples was analyzed for the full suite of COCs with ROD Table 21 RALs and PTW thresholds. This section presents a summary of the subsurface sediment data collected during the PDI.

4.2.1 *Comparison to Site-Wide RALs and PTW Thresholds*

The following is a summary of the site-wide RAL and PTW threshold exceedances in samples collected as part of the investigation. Tables 4-3a and 4-3b present the analytical results for each sample and a summary of RAL and PTW threshold exceedances, respectively.

Conventionals: Grain size analysis performed on 52 samples contained an average of 5% gravel, 31.6% sand, and 85.7% fines. TOC content ranged from 0.026% to 21% across 410 samples with an

⁸ While not explicitly stated in the PDIWP (Anchor QEA 2020a), these first phase subsurface cores can also be used to achieve the buried contamination SMA Refinement Objective in accordance with EPA's Buried Contamination Guidance (EPA 2022a). See Section 5.1.2 for additional information.

average of 1.7% and median of 1.9%. TS ranged from 40.4% to 90.5% across 549 samples with an average of 64.1% and median 60.1%.

Total PAHs: 145 of the 442 detected total PAH results exceeded the site-wide RAL (30,000 µg/kg). Total PAH results ranged from 20 to 1,330,000 µg/kg with an average of 50,900 µg/kg and median of 13,700 µg/kg.

Total cPAH/BaPEq: None of the 409 detected total cPAH results exceeded the PTW-highly toxic threshold concentration (774,000 µg/kg). The average total cPAH concentration is 4,490 µg/kg with a median of 1,410 µg/kg with individual concentrations ranging from 2.6 to 115,000 µg/kg.

Pesticides: 50 of the 244 detected total DDx results exceeded the site-wide RAL (160 µg/kg), and none exceeded the PTW-highly toxic threshold concentration (7,050 µg/kg). Total DDx results ranged from 6.85 to 2,310 µg/kg with an average of 133 µg/kg and median of 45.4 µg/kg.

Dioxin/Furans⁹:

- 39 of the 118 detected TCDD results exceeded the site-wide RAL (0.0006 µg/kg), and none exceeded the PTW-highly toxic threshold concentration (0.01 µg/kg). TCDD results ranged from 0.00003 to 0.0065 µg/kg with an average of 0.000545 µg/kg and median of 0.000356 µg/kg.
- 58 of the 116 detected PeCDD results exceeded the site-wide RAL (0.0008 µg/kg), and none exceeded the PTW-highly toxic threshold concentration (0.01 µg/kg). PeCDD results ranged from 0.0000217 to 0.00849 µg/kg with an average of 0.00106 µg/kg and median of 0.00078 µg/kg.
- None of the 158 detected PeCDF results exceeded the site-wide RALs (0.02 µg/kg) or the PTW threshold (0.02 µg/kg). PeCDF results ranged from 0.0000304 to 0.152 µg/kg with an average of 0.0148 µg/kg and median of 0.00613 µg/kg.
- None of the 155 detected TCDF exceeded the PTW threshold (0.6 µg/kg). TCDF results ranged from 0.0000476 to 0.18 µg/kg with an average of 0.0167 µg/kg and median of 0.00611 µg/kg.
- 3 of the 167 detected HxCDF results exceeded the PTW threshold (0.4 µg/kg). HxCDF results ranged from 0.0000325 to 0.484 µg/kg with an average of 0.047 µg/kg and median of 0.0122 µg/kg.

Total PCB Aroclors: 90 of the 251 detected total PCB Aroclors results exceeded the site-wide RAL (75 µg/kg), and 5 of the 251 detected results exceeded the PTW threshold (200 µg/kg). Results ranged from 21.1 to 241 µg/kg with an average of 72.8 µg/kg and median of 57.4 µg/kg.

⁹ As communicated in EPA's email dated October 28, 2022 (EPA 2022c), the remediation thresholds for TCDD and PeCDD are 0.001 and 0.0025 µg/kg, respectively. It is NW Natural's understanding that these remediation thresholds will be used in the BODR to fully delineate SMAs and identify DOC. These revised thresholds are not used for the comparison to site-wide RALs in this Combined DSR-PDIWP, and NW Natural has confirmed that application of these revised thresholds does not affect the scope of the second phase PDI discussed in Section 5.

Naphthalene: None of the 345 detected naphthalene results exceeded the PTW-NRC threshold concentration (140,000 µg/kg). Naphthalene results ranged from 0.959 to 28,800 µg/kg with an average of 981 µg/kg and median of 243 µg/kg. 145 of the 442 detected total PAH results exceeded the site-wide RAL (30,000 µg/kg).

Chlorobenzene: Chlorobenzene was not detected in any of 347 samples.

4.2.2 Comparison to Navigation Channel RALs and PTW Thresholds

The following is a summary of the navigation channel RAL and PTW threshold exceedances in samples collected as part of the investigation. Tables 4-4a and 4-4b present the analytical results for each sample and a summary of navigation channel RAL and PTW threshold exceedances, respectively.

Conventionals: TOC content ranged from 0.025% to 2.1% across 19 samples with an average of 0.439% and median of 0.055%. TS ranged from 50.9% to 90.8% across 21 samples with an average of 78.6% and median of 82.7%.

Total PAHs: None of the 19 detected total PAH results exceeded the navigation channel RAL (170,000 µg/kg). Total PAH results ranged from 30.9 to 50,000 µg/kg with an average of 4,310 µg/kg and median of 178 µg/kg.

Total cPAH/BaPEq: None of the 6 detected total cPAH results exceeded the PTW threshold (774,000 µg/kg). The average total cPAH/BaPEq concentration is 1,510 µg/kg with a median of 98.1 µg/kg with individual concentrations ranging from 4.08 to 5,550 µg/kg.

Pesticides: None of the 19 detected total DDx results exceed the navigation channel RALs (650 µg/kg) or PTW threshold (7,050 µg/kg). Total DDx results ranged from 18 to 58.1 µg/kg with an average of 38 µg/kg and median of 38 µg/kg.

Dioxin/Furans:

- None of the 3 detected TCDD results exceeded the navigation channel RALs (0.002 µg/kg), and none exceeded the PTW threshold (0.01 µg/kg). TCDD results ranged from 0.000169 to 0.000321 µg/kg with an average of 0.000263 µg/kg and median of 0.000304 µg/kg.
- None of the 3 detected PeCDD results exceeded the navigation channel RAL (0.003 µg/kg), and none exceeded the PTW threshold (0.01 µg/kg). PeCDD results ranged from 0.000183 to 0.000556 µg/kg with an average of 0.000405 µg/kg and median of 0.000475 µg/kg.
- None of the 4 detected PeCDF results exceeded the navigational channel RAL (0.2 µg/kg) or the PTW threshold (1 µg/kg). PeCDF results ranged from 0.0000717 to 0.0189 µg/kg with an average of 0.00601 µg/kg and median of 0.00253 µg/kg.

- None of the 5 detected TCDF exceeded the PTW threshold (0.6 µg/kg). TCDF results ranged from 0.0000923 to 0.156 µg/kg with an average of 0.0467 µg/kg and median of 0.000308 µg/kg.
- None of the 5 detected HxCDF results exceeded the PTW threshold (0.4 µg/kg). HxCDF results ranged from 0.000104 to 0.0531 µg/kg with an average of 0.0129 µg/kg and median of 0.000545 µg/kg.

Total PCB Aroclors: None of the 2 detected total PCB Aroclors results exceeded the navigation channel RAL (1,000 µg/kg) or PTW threshold (200 µg/kg). Results ranged from 30.8 to 47.6 µg/kg with an average of 39.2 µg/kg and median of 39.2 µg/kg.

Naphthalene: None of the 10 detected naphthalene results exceeded the PTW-NRC threshold concentration (140,000 µg/kg). Naphthalene results ranged from 3.04 to 782 µg/kg with an average of 152 µg/kg and median of 11.7 µg/kg.

Chlorobenzene: Chlorobenzene was not detected in any of 13 samples.

4.3 Riverbank Surface Soil Investigation

As described in Section 2.3.1, two surface soil samples were collected during the first phase PDI to support the determination of erodible riverbank soil. Each of these surface soil samples was analyzed for the full suite of COCs with ROD Table 21 RALs and PTW thresholds and COCs with a ROD Table 17 groundwater or riverbank soil/sediment CUL.

This section presents a summary of the surface soil data collected during the PDI. The riverbank surface soil sampling locations are shown in Figure 2-3.

4.3.1 Comparison to Site-Wide RALs and PTW Thresholds

The following is a summary of the site-wide RAL and PTW threshold exceedances in samples collected as part of the investigation. Tables 4-5a and 4-5b present the analytical results for each sample and a summary of RAL and PTW threshold exceedances, respectively.

Conventionals: TOC ranged from 0.56 to 0.81% across two samples with an average and median of 0.685%. TS ranged from 77.2 to 87.7% across four samples with an average of 82.4% and median of 82.5%.

Total PAH: None of the 2 detected total PAH results exceed the site-wide RAL (30,000 µg/kg). Total PAH results ranged from 1,500 to 2,800 µg/kg with an average of 2,150 µg/kg and median of 2,130 µg/kg.

Total cPAH/BaPEq: None of the 2 detected total cPAH results exceeded the PTW threshold (774,000 µg/kg). The average total cPAH/BaPEq concentration is 283 µg/kg with a median of 281 µg/kg with individual concentrations ranging from 186 to 380 µg/kg.

Pesticides: None of the 2 detected total DDx results exceed the site-wide RAL (160 µg/kg). Total DDx results ranged from 2.8 to 3.8 µg/kg with an average of 3.3 µg/kg and median of 3.3 µg/kg.

Dioxin/Furans:

- No results were detected for TCDD.
- None of the 2 detected PeCDD results exceeded the site-wide RAL (0.0008 µg/kg) or PTW threshold (0.01 µg/kg). PeCDD results ranged from 0.000328 to 0.000789 µg/kg with an average of 0.000559 µg/kg and median of 0.000559 µg/kg.
- None of the 2 detected TCDF results exceeded the PTW threshold (0.6 µg/kg). TCDF results ranged from 0.000237 to 0.000867 µg/kg with an average of 0.000552 µg/kg and median of 0.000552 µg/kg.
- None of the detected PeCDF results exceeded the site-wide RAL (0.2 µg/kg) or PTW threshold (0.2 µg/kg). PeCDF results ranged from 0.000631 to 0.00215 µg/kg with an average of 0.00139 µg/kg and median of 0.00139 µg/kg.
- None of the HxCDF results exceeded the PTW threshold (0.4 µg/kg). HxCDF results ranged from 0.00041 to 0.00477 µg/kg with an average of 0.00259 µg/kg and median of 0.00259 µg/kg.

Total PCB Congener: Neither of the 2 detected total PCB congeners results exceeded the site-wide RAL (200 µg/kg) or PTW threshold (75 µg/kg). Results ranged from 4.1 to 4.3 µg/kg with an average of 4.2 µg/kg and median of 4.22 µg/kg.

Naphthalene: Neither of the 2 detected naphthalene results exceed the PTW-NRC threshold concentration (140,000 µg/kg). Naphthalene results ranged from 17.3 to 20.5 µg/kg with an average of 18.9 µg/kg and median of 18.9 µg/kg.

Chlorobenzene: Neither of the 2 chlorobenzene results were detected.

4.3.2 Comparison to Riverbank Soil/Sediment Cleanup Levels

The following is a summary of the riverbank soil/sediment CUL exceedances in riverbank soil samples collected as part of the investigation. Tables 4-5a and 4-5b present the analytical results for each sample and a summary of CUL exceedances, respectively.

Metals:

- 2 of the 2 detected arsenic results exceeded the CUL (3 milligrams per kilogram [mg/kg]). Arsenic results ranged from 3.98 to 4.15 mg/kg with an average of 4.07 mg/kg and median of 4.07 mg/kg.
- The 1 detected cadmium result did not exceed the CUL (0.51 mg/kg). The detected cadmium result was equal to 0.221 mg/kg.
- The 1 detected mercury result did not exceed the CUL (0.085 mg/kg). The detected mercury result was equal to 0.0654 mg/kg.
- Neither of the 2 detected copper results exceeded the CUL (359 mg/kg). Copper results ranged from 28.4 to 41.2 mg/kg with an average of 41.2 mg/kg and median of 41.2 mg/kg.
- Neither of the 2 detected zinc results exceeded the CUL (459 mg/kg). The zinc results ranged from 56.6 to 108 mg/kg with an average of 82.3 mg/kg and median of 82.3 mg/kg.
- 1 of the 2 detected lead results exceeded the CUL (196 mg/kg). Lead results ranged from 26.5 to 3331 mg/kg with an average of 179 mg/kg and median of 179 mg/kg.

Total PAHs: Neither of the 2 detected total PAH results exceeded the CUL (23,000 µg/kg). Total PAH results ranged from 1,500 to 2,800 µg/kg with an average of 2,150 µg/kg and median of 2,130 µg/kg.

Total cPAH/BaPEq: Neither of the 2 detected total cPAH results exceeded the CUL (774 µg/kg). The average total cPAH/BaPEq concentration is 283 µg/kg with a median of 281 µg/kg with individual concentrations ranging from 186 to 380 µg/kg.

Pesticides:

- Neither of the 2 detected sum DDD results exceeded the CUL (114 µg/kg). Sum DDD results ranged from 0.148 to 0.9 µg/kg with an average of 0.524 µg/kg and median of 0.522 µg/kg.
- Neither of the 2 detected sum DDE results exceeded the CUL (50 µg/kg). Sum DDE results ranged from 0.218 to 0.377 µg/kg with an average and median of 0.297 µg/kg.
- Neither of the 2 detected sum DDT results exceeded the CUL (246 µg/kg). Sum DDT results ranged from 2.3 to 2.7 µg/kg with an average of 2.5 µg/kg and median of 2.5 µg/kg.
- Neither of the 2 detected total chlordane results exceeded the CUL (1.4 µg/kg). Total chlordane results ranged from 0.0363 to 0.561 µg/kg with an average of 0.29 µg/kg and median of 0.29 µg/kg.
- Neither of the 2 detected total DDX results exceeded the CUL (6.1 µg/kg). Total DDX results ranged from 2.8 to 3.8 µg/kg with an average of 3.3 µg/kg and median of 3.3 µg/kg.
- The 1 detected aldrin result did not exceed the CUL (2 µg/kg). The detected aldrin result was equal to 0.0215 µg/kg.
- The 1 detected BHC result did not exceed the CUL (5 µg/kg). The detected BHC result was equal to 0.00288 µg/kg.

- 1 of the 2 detected dieldrin results exceeded the CUL (0.07 µg/kg). Dieldrin results ranged from 0.0297 to 0.132 µg/kg with an average of 0.808 µg/kg and median 0.0809 µg/kg.

Dioxin/Furans:

- No results were detected for TCDD.
- 2 of the 2 detected PeCDD results exceeded the CUL (0.0002 µg/kg). PeCDD results ranged from 0.000328 to 0.000789 µg/kg with an average of 0.000559 µg/kg and median of 0.000559 µg/kg.
- 1 of the 2 detected TCDF results exceeded the CUL (0.00040658 µg/kg). TCDF results ranged from 0.000237 to 0.000867 µg/kg with an average of 0.000552 µg/kg and median of 0.000552 µg/kg.
- 2 of the 2 detected PeCDF results exceeded the CUL (0.0003 µg/kg). PeCDF results range from 0.000631 to 0.00215 µg/kg with an average of 0.00139 µg/kg and median of 0.00139 µg/kg.
- 2 of the 2 detected HxCDF results exceeded the CUL (0.0004 µg/kg). HxCDF results ranged from 0.00041 to 0.00477 µg/kg with an average of 0.00259 µg/kg and median of 0.00259 µg/kg.
- Neither of the 2 detected total dioxin/furan TEQ 2005 (mammal) results exceeded the CUL (0.01 µg/kg). Total dioxin/furan TEQ 2005 (mammal) results ranged from 0.0014 to 0.00506 µg/kg with an average of 0.00323 µg/kg and median of 0.00323 µg/kg.

Total PCB Congener: Neither of the 2 detected total PCB congeners results exceeded the CUL (9 µg/kg). Results ranged from 4.1 to 4.3 µg/kg with an average of 4.2 µg/kg and median of 4.22 µg/kg.

Total Petroleum Hydrocarbons: Neither of the 2 detected diesel range hydrocarbons exceeded the CUL (91 mg/kg). Results ranged from 7.56 to 8.31 mg/kg with an average and median of 7.94 mg/kg.

4.4 Riverbank Angled Boring Subsurface Soil Investigation

As described in Section 2.3.2, 11 subsurface soil samples were collected during the first phase PDI to support the characterization of the wedge of soil between the top of the riverbank and the sediments at the toe of the riverbank slope. Each of these riverbank angled boring samples was analyzed for the full suite of COCs with ROD Table 21 RALs and PTW thresholds and COCs with a ROD Table 17 groundwater or riverbank soil/sediment CUL.

This section presents a summary of the subsurface soil data collected during the PDI. The riverbank subsurface soil sampling locations are shown in Figure 2-3.

4.4.1 Comparison to Site-Wide RALs and PTW Thresholds

The following is a summary of the site-wide RAL and PTW threshold exceedances in samples collected as part of the investigation. Tables 4-6a and 4-6b present the analytical results for each sample and a summary of RAL and PTW threshold exceedances, respectively.

Conventionals: Grain size performed on 6 riverbank soil/sediment samples contained an average of 1.96% gravel, 53.3% sand, and 45% fines. TOC content ranged from 0.06% to 2.9% with an average of 0.737% and median of 0.54%. TS ranged from 64.2% to 90.1% across 33 samples, with an average of 78.9% and median of 80%.

Total PAHs: None of the 33 detected total PAH results exceeded the site-wide RAL (30,000 µg/kg). Total PAH results ranged from 15 to 24,000 µg/kg with an average of 5,010 µg/kg and median of 3,900 µg/kg.

Total cPAH/BaPEq: None of the 33 detected total cPAH results exceeded the PTW threshold (774,000 µg/kg). The average total cPAH/BaPEq concentration is 715 µg/kg with a median of 581 µg/kg with individual concentrations ranging from 1.6 to 2,900 µg/kg.

Pesticides: None of the 31 detected total DDX results exceeded the PTW threshold (7050 µg/kg) and site-wide RAL (160 µg/kg). Total DDX results ranged from 0.00836 to 35 µg/kg with an average of 4.58 µg/kg and median of 2.35 µg/kg.

Dioxin/Furans:

- None of the 7 detected TCDD results exceeded the PTW threshold (0.01 µg/kg) or site-wide RAL (0.0006 µg/kg). TCDD results ranged from 0.000058 to 0.000235 µg/kg with an average of 0.000147 µg/kg and median of 0.000131 µg/kg.
- None of the 15 detected PeCDD results exceeded the PTW threshold (0.01 µg/kg) or site-wide RAL (0.0008 µg/kg). PeCDD results ranged from 0.0000782 to 0.000558 µg/kg with an average of 0.000201 µg/kg and median of 0.000172 µg/kg.
- None of the 16 detected TCDF results exceeded the PTW threshold (0.6 µg/kg). TCDF results ranged from 0.000139 to 0.0144 µg/kg with an average of 0.00116 µg/kg and median of 0.000245 µg/kg.
- None of the 22 detected PeCDF results exceeded the PTW threshold (0.2 µg/kg) or site-wide RAL (0.2 µg/kg). PeCDF results ranged from 0.000102 to 0.00857 µg/kg with an average of 0.00108 µg/kg and median of 0.000742 µg/kg.
- None of the 19 detected HxCDF results exceeded the PTW threshold (0.4 µg/kg). HxCDF results ranged from 0.00998 to 0.000102 µg/kg with an average of 0.00126 µg/kg and median of 0.00061 µg/kg.

Total PCB Aroclors: None of the 17 detected total PCB Aroclors exceeded the PTW threshold (200 µg/kg) or site-wide RAL (75 µg/kg). Total PCB Aroclors ranged from 7.57 to 20.5 µg/kg with an average of 11.2 µg/kg and median of 10.1 µg/kg.

Naphthalene: None of the 31 detected naphthalene results exceeded the PTW-NRC threshold concentration (140,000 µg/kg). Naphthalene results ranged from 0.54 to 697 µg/kg with an average of 70.4 µg/kg and median of 33.5 µg/kg.

Chlorobenzene: Chlorobenzene was not detected in any of the 33 samples.

4.4.2 *Comparison to Riverbank Soil/Sediment Cleanup Levels*

The following is a summary of the CUL exceedances in riverbank angled boring samples collected as part of the investigation. Tables 4-6a and 4-6b present the analytical results for each sample and a summary of CUL exceedances, respectively. Except for one interval (20 to 32.1 feet below ground surface at USMPDI-068), all sampled angled riverbank location depth intervals had at least one detected CUL exceedance.

Metals:

- 29 of 33 detected arsenic results exceeded the CUL (3 mg/kg). Arsenic results ranged from 2.52 to 8.23 µg/kg with an average of 4.24 µg/kg and median of 3.75 µg/kg.
- 5 of 17 detected cadmium results exceeded the CUL (0.51 mg/kg). Cadmium results ranged from 0.132 to 1.77 µg/kg with an average of 0.438 µg/kg and median of 0.196 µg/kg.
- 4 of 33 detected lead results exceeded the CUL (196 mg/kg). Lead results ranged from 6.29 to 7,120 µg/kg with an average of 316 µg/kg and median of 21.8 µg/kg.
- 7 of 14 detected mercury results exceeded the CUL (0.085 mg/kg). Mercury results ranged from 0.057 to 0.502 µg/kg with an average of 0.122 µg/kg and median of 0.0853 µg/kg.
- 3 of 33 detected zinc results exceeded the CUL (459 mg/kg). Zinc results ranged from 50.9 to 1,560 µg/kg with an average of 150 µg/kg and median of 71.1 µg/kg.

Total PAHs: 1 of 33 detected results exceeded the total PAH CUL (23,000 µg/kg). Total PAH CUL results ranged from 15 to 24,000 µg/kg with an average of 5,010 µg/kg and median of 3,900 µg/kg.

Total cPAH/BaPEq: 12 of 33 detected results exceeded the CUL (774 µg/kg). The average total cPAH/BaPEq concentration is 715 µg/kg with a median of 581 µg/kg with individual concentrations ranging from 1.6 to 2,900 µg/kg.

Dioxin/Furans:

- 2 of 7 detected TCDD results exceeded the CUL (0.0002 µg/kg). TCDD results ranged from 0.000058 to 0.000235 µg/kg with an average of 0.000147 µg/kg and median of 0.000131 µg/kg.

- 6 of 15 detected PeCDD results exceeded the CUL (0.0002 µg/kg). PeCDD results ranged from 0.0000782 to 0.000558 µg/kg with an average of 0.000201 µg/kg and median of 0.000172 µg/kg.
- 4 of 16 detected TCDF results exceeded the CUL (0.00040658 µg/kg). TCDF results ranged from 0.000139 to 0.0144 µg/kg with an average of 0.00116 µg/kg and median of 0.000245 µg/kg.
- 17 of 22 detected PeCDF results exceeded the CUL (0.0003 µg/kg). PeCDF results ranged from 0.000102 to 0.00857 µg/kg with an average of 0.00108 µg/kg and median of 0.000742 µg/kg.
- 13 of 19 detected HxCDF results exceeded the CUL (0.0004 µg/kg). HxCDF results ranged from 0.000102 to 0.00998 µg/kg with an average of 0.00126 µg/kg and median of 0.00061 µg/kg.
- None of 33 detected total dioxins/furans exceeded the TEQ 2005 (mammal) CUL. Total dioxins/furans results ranged from 0.0000976 to 0.0081 µg/kg with an average of 0.00115 µg/kg and median of 0.000666 µg/kg.

Total PCB Aroclors: 10 of 17 detected results exceeded the CUL for PCB Aroclors (9 µg/kg). Results ranged from 7.57 to 20.5 µg/kg with an average of 11.2 µg/kg and median of 10.1 µg/kg.

Pesticides: 2 of 23 detected dieldrin results exceeded the CUL (0.07 µg/kg). 5 of 31 detected total DDx results exceed the CUL (6.1 µg/kg). Dieldrin results ranged from 0.0025 to 0.225 µg/kg with an average of 0.0422 µg/kg and median of 0.0231 µg/kg. Total DDx results range from 0.00836 to 35 µg/kg with an average of 4.58 µg/kg and median of 2.35 µg/kg.

Total Petroleum Hydrocarbons: 5 of 27 detected diesel range hydrocarbons results exceeded the CUL (91 mg/kg). Diesel range hydrocarbons results ranged from 5.68 to 3,460 µg/kg with an average of 193 µg/kg and median of 48.9 µg/kg.

There were no other CUL exceedances in the riverbank angled boring samples.

5 Second Phase Pre-Design Investigation Work Plan

This section summarizes the proposed scope of work for the second phase PDI to fill data gaps to achieve the SMA Refinement, CSM Refinement, and Remedial Technology Refinement Objectives based on the first phase PDI results presented in Sections 1 through 4.

5.1 SMA Refinement Objective

The first phase PDI included 56 surface sediment sampling locations for SMA delineation. This section discusses the collected data and evaluates the need for additional data gaps associated with the SMA Refinement Objective.

5.1.1 Surface Sediment Sampling and Analysis

As discussed in Section 1.2 of the PDIWP (Anchor QEA 2020a), a primary objective of the first phase PDI was to collect additional surface sediment data in the Project Area to further refine the post-ROD SMAs (described in Section 3.2 of the PDIWP) using ROD-identified RAL and PTW lines of evidence (described in Section 3.1 of the PDIWP). The high-density sampling program performed during the first phase PDI achieved the surface sediment SMA Refinement Objective within the Project Area. However, RAL and PTW threshold exceedances were measured in surface sediment samples at five locations (USMPDI-001, USMPDI-023, USMPDI-027, USMPDI-039, and USMPDI-045) adjacent to the navigation channel boundary. To laterally bound the surface sediment SMAs, NW Natural proposes the collection of five channelward three-point composite surface sediment samples within the B1 Navigation Channel Project Area, immediately adjacent to the US Moorings Project Area. The sampling locations are shown in Figure 5-1. Each of these surface sediment samples will be analyzed for the full suite of COCs with ROD Table 21 RALs and PTW thresholds.

In addition to the five channelward locations, NW Natural proposes the collection of one additional three-point composite surface sediment sample (for a total of six surface sediment sample locations) to laterally bound the downriver extents of RAL and PTW-highly toxic threshold exceedances near location PDI-171 within the Gasco Sediments Site Project Area (see Figure 5-1¹⁰). For the purposes of the Gasco Sediments Site *Combined Sediment Remedy Basis of Design and Preliminary Design Report* (Combined BOD-PDR; Anchor QEA 2021), the downriver boundary of the Gasco Sediments Site Project Area was administratively established as 75 feet downriver of PDI-171. This additional surface sediment sample will enable empirical determination of the downriver

¹⁰ The Section 5 figures show SMAs that were developed using surface sediment data consistent with the ROD-identified methods using the post-ROD data set identified in the PDIWP (Anchor QEA 2020a) and first phase PDI results. Following the second phase PDI, the SMAs will be revised to include subsurface sediment data, as necessary, as discussed in Section 5.1.2. Therefore, the SMAs shown on these figures are being used for informational purposes to inform the second phase PDIWP.

boundary of the Gasco Sediments Site Project Area, consistent with NW Natural's commitment in Section 4.1.1 of the Combined BOD-PDR, which states:

"This boundary also represents the edge of two other adjacent project areas; therefore, any sediment exceedances that may exist further downriver than this estimated downriver Final Project Area extent will either be addressed separately by NW Natural as part of the B1 Navigation Channel Project Area pursuant to the AOC (CERCLA Docket No. 10-2009-0255) and the *Remedial Design Statement of Work, Portland Harbor Superfund Site, B1 Navigation Channel Project Area* (EPA 2020c) or the U.S. Moorings Project Area pursuant to the AOC (CERCLA Docket No. 10-2009-0255) and the *Remedial Design Statement of Work, Portland Harbor Superfund Site, U.S. Moorings Project Area* (EPA 2020d)."

The surface sediment sampling and logging procedures will be performed consistent with those identified in Sections 3.3.2 and 3.3.3 of the *Second Phase Pre-Design Investigation Field Sampling Plan* (Second Phase PDI FSP; Appendix G). Samples will be analyzed for the full list of COCs with ROD Table 21 RALs and PTW thresholds parameters identified in Table G5-1 of the Second Phase PDI FSP (Appendix G). The need for additional step-out samples farther out in the navigation channel will be evaluated following receipt of data from the second phase PDI.

All surface sediment sampling work will be completed in accordance with the EPA-approved version of this Combined DSR-PDIWP and associated Second Phase PDI FSP (Appendix G), *Second Phase Pre-Design Investigation Quality Assurance Project Plan* (Second Phase PDI QAPP; Appendix H), and *Revised Final Emergency Response and Health and Safety Plan* (ERHASP; Anchor QEA 2020d).

5.1.2 Buried Contamination Evaluations

Section 3.5 of the PDIWP (Anchor QEA 2020a) focuses on surface sediment samples to refine SMAs. However, since the PDI work was initially completed, EPA released a document titled *Buried Contamination Guidelines for Portland Harbor Site* (Buried Contamination Guidance; EPA 2022a) on January 18, 2022. This document states, "In some areas, sediment focused contaminants of concern (COCs) that exceed the remedial action levels (RALs) or principal threat waste (PTW) thresholds may be buried beneath sediments with concentrations less than RAL and PTW thresholds. Whether or not these areas will be included in a sediment management area (SMA) depends on the chemical and physical stability of the buried contamination and reasonably anticipated future site uses."

During the first phase PDI, 56 subsurface cores, co-located with the 56 surface sediment samples identified in Section 5.1.1, were collected as part of the Remedial Technology Refinement Objective and sampled to support delineation of the DOC and associated dredge prisms and performance of capping demonstrations throughout the SMAs (see Section 5.4 of the PDIWP [Anchor QEA 2020a]).

While not explicitly stated in the PDIWP, these first phase subsurface cores can also be used to achieve the buried contamination SMA Refinement Objective in accordance with EPA's Buried Contamination Guidance (EPA 2022a) using the following lines of evidence (LOEs):

- **LOE 1: Presence of Buried Contamination (i.e., Comparison of Surface and Subsurface Sediment Data to RALs and PTW Thresholds).** NW Natural reviewed surface and subsurface sediment data from the 56 first phase PDI sample locations to identify locations where buried contamination exists, as defined by locations with RAL or PTW threshold exceedances in the subsurface (i.e., below 30 cm) and surface concentrations below RAL and PTW thresholds. NW Natural identified 34 locations where buried contamination is present; therefore, the evaluation of LOE 2 and LOE 3 is necessary.
 - **Data Gaps:** To further support this evaluation and to laterally bound all SMAs, subsurface sediment cores should be collected at each of the 6 surface grab sample locations discussed in Section 5.1.1 (see Figure 5-2). These sediment cores would be sampled to delineate DOC and potential buried contamination at the proposed locations. Additional information is presented in Section 5.1.2.1.
- **LOE 2: Physical Stability.** At locations with potential buried contamination, first phase PDI DOC data and the 7 additional proposed cores described in the bullet above can be used to evaluate the physical stability line of evidence described in the Buried Contamination Guidance (EPA 2022a). The Buried Contamination Guidance states that physical stability should be evaluated for "exposure of buried contamination due to disturbances from large flood events (100-year event), wind and vessel generated waves, vessel propwash, earthquakes, slope instability, in-water construction or maintenance activities, impacts of climate change and other anthropogenic impacts expected due to current or future site uses."
 - **Data Gaps:** The site CSM information discussed in Section 4 of the PDIWP (Anchor QEA 2020a) can be used to complete most of the physical stability evaluations described in the Buried Contamination Guidance (EPA 2022a). However, there are relatively small portions of the Project Area with relatively old elevation data, particularly in the nearshore-most areas where the 2018 David Evans and Associates survey, performed as part of the Pre-RD Group baseline monitoring sampling work, did not achieve complete coverage. The nearshore data was most recently collected by Light Detection and Ranging (LiDAR) in 2014. NW Natural proposes the collection of nearshore bathymetry/topography data (the data collection method will be determined by the surveyor based on water levels and equipment access) to further support sediment physical stability evaluations to be performed in the BODR. The methodologies used will be identical to those used during the Gasco 2019 bathymetric/topographic data collection effort (Anchor QEA 2019b). Additional information is presented in Section 5.1.2.2.

- **LOE 3: Chemical Stability.** At the 34 locations with buried contamination, first phase PDI capping evaluation bulk sediment data can be used to evaluate the chemical stability line of evidence (i.e., potential for upward dissolved-phase transport of buried contaminants) described in the Buried Contamination Guidance (EPA 2022a).
 - **Data Gaps:** Site-specific seepage velocity data is a key model parameter to evaluate chemical stability of buried contamination. Because seepage meter data does not exist within the Project Area, NW Natural proposes the collection of 11 seepage meters within the Project Area. Additional information is presented in Section 5.1.2.3.

While this Combined DSR-PDIWP focuses on first phase PDI subsurface sediment data, it should be noted that future buried contamination evaluations performed for the BODR will include historical subsurface sediment data.

5.1.2.1 Subsurface Sediment DOC Sampling and Analysis

As identified in Section 5.1.2, 7 subsurface sediment cores will be collected and analyzed to delineate DOC.¹¹ Based on a review of DOC in cores just shoreward of the proposed DOC cores (see Figure 5-2), it is anticipated that any subsurface contamination in the proposed cores would be limited to the upper 4 to 5 feet. Therefore, sampling and chemical analysis will be performed for the depth intervals specified as follows:

- Sample consecutive 1-foot intervals beginning at the mudline to the bottom of the core recovery depth.
- If no visual indication of contamination is observed, submit for chemical analysis a minimum of four 1-foot intervals starting at the mudline (0- to 1-foot interval) and proceeding downward in the core to the 3- to 4-foot interval. If visual contamination is observed below the first 4 feet of core sampled, submit for chemical analysis additional 1-foot intervals until two consecutive 1-foot intervals of visual and olfactory unimpacted sediment are sampled.
 - At the single location offshore of USMPDI-056, which has a DOC of 6 feet, the first six 1-foot intervals would be submitted for chemical analyses.
- Archive all other 1-foot sample intervals from the core to be triggered, as needed, based on results from the intervals submitted for chemical analyses.

The subsurface sediment core sampling and processing methods and core logging procedures will be performed consistent with those identified in Sections 3.3.2 and 3.3.3 of the Second Phase PDI FSP (Appendix G). Samples triggered for chemical analysis will be analyzed for the full list of ROD

¹¹ The DOC cores identified as part of the SMA Refinement Objective will also be used to fill data gaps associated with the Remedial Technology Refinement Objective, as discussed in Section 5.3. While these 7 sediment cores are located outside of the Project Area in the navigation channel, they are being proposed as part of the US Moorings second phase PDI to laterally bound the RAL and PTW threshold exceedances present immediately shoreward of the navigation channel boundary.

Table 21 RALs and PTW-highly toxic thresholds parameters in Table G5-1 of the Second Phase PDI FSP (Appendix G).

All subsurface sediment sampling work will be completed in accordance with the EPA-approved version of this Combined DSR-PDIWP and associated Second Phase PDI FSP (Appendix G), Second Phase PDI QAPP (Appendix H), and ERHASP (Anchor QEA 2020d).

5.1.2.2 Bathymetry/Topography

As discussed in Section 5.1.2, NW Natural proposes the collection of nearshore bathymetric/topographic data to support the physical stability evaluations described in EPA's Buried Contamination Guidance (EPA 2022a). The surveyor (eTrac) and the data collection methods will be identical to those described in Section 2.2 of Anchor QEA's *Hydrographic and Topographic Survey Work Plan* for the Gasco Sediments Site (Anchor QEA 2019b). It is expected that eTrac will collect topographic mobile LiDAR data in unsubmerged areas and will collect high-resolution multibeam echosounder data in submerged areas. The anticipated footprint for data collection is the entire Project Area (as shown in Figure 1-1) and will extend channelward into the river approximately an additional 150 feet and into the uplands beyond the top of the riverbank. Additional details about the sample collection are included in the Second Phase PDI FSP (Appendix G).

5.1.2.3 Seepage Meters

As discussed in Section 5.1.2, NW Natural proposes the deployment of eleven seepage meters¹² to obtain empirical data on zones of groundwater discharge and recharge in the Project Area that will be used as part of the fate and transport modeling for the buried contamination chemical stability evaluation and cap modeling demonstrations. The target locations are shown in Figure 5-3. As requested by EPA in an email dated July 25, 2022, additional groundwater information, including supplemental figures, and related communications are included in Appendix I to support the selection of seepage meter locations.

Figure 5-3 shows all historical and first phase PDI locations with buried contamination (i.e., no RAL exceedances or PTW threshold exceedances in surface sediments, but one or more RAL or PTW threshold exceedances in subsurface sediment interval[s] below 1 foot). The seepage meter locations were selected to cover both the ROD-identified shallow and intermediate regions of the US Moorings Project Area with location density and spacing similar to the EPA-approved 2017 interim summer and 2018 interim spring groundwater seepage investigations at the Gasco Sediments Site Project Area. Seepage meters were also spaced to adequately cover the following: 1) areas inside of surface sediment exceedance-based SMA footprints, to be used for potential cap modeling evaluation purposes; and 2) areas outside of surface-based SMA footprints to inform

¹² The seepage meters identified as part of the SMA Refinement Objective will also be used to fill data gaps associated with the Remedial Technology Refinement Objective, as discussed in Section 5.3.

buried contamination evaluations and, if needed, potential future capping evaluations. Preference was given to locations with deeper RAL or PTW threshold exceedances, as these locations are more likely candidates for buried contamination or potential future capping. As a final measure, NW Natural reviewed surface sediment grain size data to confirm the proposed locations cover the general range of grain sizes within the Project Area.

Anchor QEA evaluated adding a minimum of one to two seepage meter locations closer to the navigation channel but still within the capping footprint in the intermediate region. As shown in Figure 5-3, the DOCs (see bold font callouts adjacent to each first phase PDI core location) within 150 feet of the navigation channel boundary are less than or equal to 6 to 7 feet (total of four locations) except in two isolated locations where the DOCs are 10 and 14 feet. As discussed in Section 5.3.1, the ROD assumed that 5 feet of dredging would occur prior to capping in the shallow and intermediate regions in ROD Sections 14.2.3 and 14.2.4 (as a presumptive non-mitigating remedy). Therefore, a simple screening for the potential applicability of capping in these regions is dependent on the DOC being below 5 feet or if the DOC is caused by deep buried contamination. NW Natural believes the marginally deeper DOCs at 6 and 7 feet (which do not include buried contamination) would likely be more cost effective to dredge than cap. In addition, the 14-foot DOC is located directly adjacent to the US Moorings L-dock within the future maintenance dredge area, so capping is not considered feasible in that location.

As stated in footnote 5 in Figure 5-3, the “Post-ROD SMAs + First Phase PDI Data” were developed consistent with ROD-identified methodologies using surface sediments only. As requested in EPA’s *Remedial Design Guidelines and Considerations* (EPA 2021a), dated April 23, 2021, NW Natural will revise the SMA boundaries to include subsurface sediment data, pending the results of buried contamination evaluations described in EPA’s *Buried Contamination Guidance* (EPA 2022a). The proposed seepage meters shown in Figure 5-3 that are located outside of the surface-based SMAs will be used for buried contamination evaluations. Data collected from these seepage meter locations may also be used for cap modeling evaluations, if applicable, in areas that become part of the final SMAs following buried contamination evaluations. The proposed seepage meters located within the surface-based SMAs will be used as necessary to support cap modeling evaluations.

NW Natural proposes to deploy the identical type of seepage meter used during the EPA-approved 2017 interim summer and 2018 interim spring groundwater seepage investigations at the Gasco Sediments Site to empirically measure groundwater seepage. In addition, the identical type of seepage meter was used during *Portland Harbor Remedial Investigation/Feasibility Study* sampling in 2005. A detailed description of these meters and the type of data that will be obtained is provided in the following documents.

- *Revised NW Natural Proposed Summer 2017 Interim Pre-Remedial Design Data Gaps Field Sampling – Gasco Sediments Site* (Anchor QEA 2017)

- *Revised NW Proposed Spring 2018 Interim Pre-Remedial Design Data Gaps Field Sampling – Gasco Sediments Site* (Anchor QEA 2018)
- *Portland Harbor RI/FS Round 2 Groundwater Pathway Assessment Sampling and Analysis Plan – Attachment 1 Field Sampling Plan Groundwater Plume Discharge Mapping* (Integral 2005a)

The meters are ultrasonic seepage meters available through Coastal Monitoring Associates (CMA), located in San Diego, California.

Ultrasonic seepage meters are capable of time-series flow rate measurement, which captures both positive and negative seepage at the surface water-sediment interface. Seepage time series measurements will be reported at hourly average values based on the underlying 1-second sampling rate of the meter. Hourly rates will subsequently be used to determine tidal-cycle averages by averaging over the tidal period of approximately 25 hours. If seepage data are not collected simultaneously at all seepage monitoring locations, data will be recorded from a nearby tide gauge (U.S. Geological Survey or otherwise) so changes in tidal amplitude (natural or storm induced) can be evaluated in conjunction with the seepage data. Data from the most proximal Gasco property upland source control system gauges will be recorded and used as necessary to support evaluation of the seepage meter data.

Conductivity and temperature will be monitored using a logger placed inside each seepage meter funnel. Consistent with the Gasco Sediments Site, study-wide pressure will be monitored by placing a single pressure sensor at a fixed location (pier piling or similar structure) for the duration of the seepage meter deployment period.

The seepage meters need to be deployed in at least 5 feet of river water to remain submerged during deployment. Four of the eleven seepage meter locations proposed by NW Natural are located within nearshore areas of the Project Area that are not expected to have sufficient water depth during periods of low water in the late summer and early fall. Considering water depth requirements and the effects of seasonality of seepage velocities, the first round of proposed seepage meter deployment and data collection was approved by EPA for expedited implementation and performed between September 29 through October 5 when the river surface water elevations were low relative to high upland groundwater elevations. This condition provided the highest potential groundwater seepage fluxes in the Project Area. Due to water depth limitations, the first deployment was limited to seven seepage meters in the deeper offshore areas of the Project Area.

The second round of proposed deployment includes collection of data from eleven proposed locations, seven of which are collocated with the offshore locations and four additional shallow nearshore locations. NW Natural is targeting deployment of the second round of seepage meters between March through early April 2023, when river surface elevations are high relative to the upland groundwater elevations and allow for the meters to be submerged in the four nearshore

areas of the Project Area. However, initial outreach to the seepage meter subcontractor has identified potential scheduling conflicts until May 2023. Anchor QEA will continue to discuss scheduling this work and will coordinate as necessary with EPA in early 2023 if the target window cannot be achieved.

CMA (the same contractor that performed the deployment during the EPA-approved interim 2017 and 2018 groundwater seepage investigations at the Gasco Sediments Site) is available to deploy the seepage meters in September and October 2022 at all locations with sufficient overlying water depth. All meters will be deployed by a certified dive team under an EPA-approved Diver Health and Safety Plan that will be developed by the diving contractor and submitted to EPA for review and approval at least 2 months prior to mobilization. It is expected that the Diver Health and Safety Plan will be similar to the plan developed by Research Support Systems for their diving operations to support the 2017 and 2018 groundwater seepage investigations at the Gasco Sediments Site (RSS 2017) and will be updated as necessary to reflect current personnel, certifications, and practices (including COVID-19 mitigation measures). Consistent with the 2017 and 2018 groundwater seepage investigations at the Gasco Sediments Site (Anchor QEA 2017, 2018), NW Natural proposes deployment of each seepage meter for a period of 3 days to update groundwater seepage variations over multiple tidal cycles. The proposed seepage meter discharge flow measurement, decontamination, and field documentation procedures will be performed consistent with the 2017 and 2018 groundwater seepage investigations (Anchor QEA 2017a).

Precautions will be taken to limit seepage meter exposure to surface waves and wakes due to nearby vessels. Thorough notes will be taken during deployment regarding any potential sources of disturbance, and automatic identification system (AIS) ship logs will be recorded for possibly interfering vessel wakes encountered during seepage meter deployment.

5.2 CSM Refinement Objective

The first phase PDI included a focused number of locations for targeted performance of riverbank angled borings and riverbank surface soils. This focused data collection provided initial Project Area-specific baseline data for these media to fill any remaining CSM Refinement Objective data gaps. As discussed in Section 2.3.1 and in the EPA-approved FCR #3 (Table 1-1; Appendix A), Anchor QEA and EPA personnel performed a visual reconnaissance of the riverbank prior to collection of riverbank surface soil samples. The majority of the riverbank was covered in riprap and gravel that exceeded the definition of erodible soils (material less than 2 inches in diameter, per Section 3.3.2 of the First Phase FSP [Anchor QEA 2020b]) with little exposed soil. In addition, an opportunistic habitat assessment was performed concurrent with the riverbank reconnaissance. Additional information and supporting documentation for the habitat assessment are provided in Appendix L.

Of the 11 riverbank boring locations and 2 surface soil locations, none of the locations exceeded the PTW thresholds or site-wide RALs; CUL exceedances are summarized in Section 4.3. During the field effort visual reconnaissance, as confirmed by EPA oversight, there was a lack of erodible surface soils along the riverbank, so no additional surface soil samples could be collected. In addition, sufficient riverbank angled boring data were collected to meet the riverbank soil characterization objective. No additional CSM refinement data gaps have been identified.

5.3 Remedial Technology Refinement Objective

As described in the SOW (EPA 2020a) and Section 14.2 of the ROD (EPA 2017), additional design-level sampling is required to support refinement of the ROD-identified remedial technologies in each project area. Subsurface sediment data collected during the first phase PDI was intended to support identification of the DOC and performance of capping demonstrations throughout the SMAs in the Project Area.

The first phase PDI sampling included the collection of subsurface sediment data at 56 locations consistent with EPA's PDI data density requirements, which also meet the DOC and capping demonstration objectives. At 26 of the first phase PDI locations, insufficient sample depth was achieved to identify the DOC. Table 5-1 summarizes these 26 locations. The DOC may not be required to support RD in areas where capping is the selected remedial technology, and the identification of dredging versus capping technologies will not occur until development of the BODR. Therefore, NW Natural proposes to determine whether additional DOC cores may need to be collected in these vertically unbounded areas during RD based on the outcome of the BODR remedial technology evaluations. The six additional proposed DOC cores to support buried contamination evaluations associated with the SMA Refinement Objective (discussed in Section 5.1.2.1) will also support the Remedial Technology Refinement Objective of delineating DOC.

The subsurface sediment capping demonstration DQOs were achieved during the first phase PDI, so no data gaps were identified for those core locations. The additional six proposed subsurface sediment DOC cores were evaluated to determine whether the capping demonstration data objective would be required for these cores. A review of bathymetry and DOC at nearby first phase PDI subsurface sampling locations indicates that RAL and PTW threshold exceedances (if there are any in the proposed second phase PDI DOC cores) would likely be located above the elevation at which capping becomes feasible in the navigation channel (see discussion in Section 6.2.2 of the PDIWP [Anchor QEA 2020a]). Therefore, capping demonstration bulk sediment data will not be collected from any of the proposed second phase PDI sediment core locations. In addition, the seepage meter data collected to support buried contamination analyses for the SMA Refinement Objective (see Section 5.1.2.2) will also be used to inform cap modeling evaluations within the final SMAs during RD.

Consistent with the Gasco Sediments Site DGWP (Anchor QEA 2019a), NW Natural will perform dredged material waste handling, transport, and disposal classification evaluations to pre-characterize the sediments that may potentially be dredged, transported, and disposed of off site. Sampling and analysis for each objective is discussed in Section 5.3.1. This data will be used to support determination of constructability, environmental protectiveness, and cost-effectiveness of dredging and capping technologies within the SMAs.

5.3.1 Dredged Material Handling, Transport, and Disposal Sampling and Analysis

NW Natural proposes to collect sediment from 12 subsurface sampling locations to support the following data objectives:

- Dredge material haul barge dewatering testing (Figure 5-4)
- Dredge material stabilization testing (Figure 5-4)
- Dredge material disposal suitability testing (Figure 5-5)

A 16-foot or 20-foot vibracore¹³ will be collected from each of the 12 proposed locations and will be sampled, treated, and analyzed, as discussed in Sections 5.3.1.1 through 5.3.1.3. Because the final SMA extents are not yet known (see Section 5.1), the sample locations were selected to spatially cover the various regions (shallow, intermediate, and navigation channel/FMD) of the Project Area and to provide representative data throughout the Project Area. Proposed samples conservatively represent the upper range of contaminant concentrations. After finalizing the SMAs, NW Natural will evaluate whether additional sampling is required for dredged material handling, transport, and disposal evaluations.

Locations in the navigation channel/FMD regions will be sampled from the mudline to the bottom DOC identified in nearby cores to simulate removal of the full DOC at these locations. In ROD Sections 14.2.3 and 14.2.4 (EPA 2017), EPA assumed that 5 feet of dredging would occur prior to capping in the shallow and intermediate regions (as a presumptive non-mitigating remedy); therefore, samples from these regions would be collected from 0 to 5 feet unless the DOC is only marginally deeper than 5 feet (i.e., DOC of up to 7 feet). Locations within the shallow and intermediate regions that have a DOC slightly deeper than 5 feet will be sampled from the mudline to the DOC because the final technology assignment in these areas may show that full removal is more cost-effective and environmentally protective than dredging and capping a thin interval of contaminated sediment. Sample intervals depths are presented in Table G3-3 of the Second Phase PDI FSP (Appendix G).

¹³ Consistent with the approach used during the first phase PDI, 20-foot sediment cores will be collected from the offshore portions of the Project Area and 16-foot sediment cores from the nearshore portions of the Project Area where water depth limits access needed for the 20-foot coring equipment.

Sample collection methodologies and analytical testing are discussed in detail in the Second Phase PDI FSP (Appendix G) and Second Phase PDI QAPP (Appendix H).

5.3.1.1 Dredge Material Haul Barge Dewatering Testing

In addition to the bulk sediment samples described in Section 5.3.1, river water from the Project Area will be collected to be used for the haul barge dewatering testing. Standard elutriate test methods, identical to those used for the Gasco Sediments Site and described in Section 3.5.1.1 of the DGWP (Anchor QEA 2019a), will be followed. This testing involves mixing the sediment and water in a specified ratio, followed by agitation of the slurry mixture for a specified period, settling or filtration of solids, and analysis of the resulting water column. Standard elutriate tests will be conducted in accordance with national dredged material disposal guidelines (EPA and USACE 1991). The quality of the dredge elutriate will then be compared to the appropriate water quality standards based on the selected elutriate management option.

Additional information regarding methodologies is presented in Section 5.2.2 of the Second Phase PDI FSP (Appendix G).

Consistent with the discussion in Section 3.5.1.1 of the DGWP (Anchor QEA 2019a), for discharge of the dredge haul barge elutriate back to the river in the construction area, due to the short-term and intermittent nature of dredge dewatering elutriate discharges, and because construction activities will only be occurring during a portion of the day (i.e., non-24-hour work shifts), the appropriate standards for water quality evaluation are acute water quality criterion. NW Natural proposes analyzing the dredge dewatering elutriate samples for those chemicals containing ROD Table 17 surface water CULs that have applicable acute water quality criteria or reliable acute ecological screening values for surface water, which include the following:

- Acute freshwater Criterion Maximum Concentration (CMC) identified in the Oregon Department of Environmental Quality's (DEQ's) *Table 30: Aquatic Life Water Quality Criteria for Toxic Pollutants* (Oregon Administrative Rule 340-041-8033)
- Acute freshwater CMC identified in EPA's *National Recommended Water Quality Criteria – Aquatic Life Criteria Table* (EPA 2019b)
- *Procedures for the Derivation of Equilibrium Partitioning Sediment Benchmarks (ESBs) for the Protection of Benthic Organisms: PAH Mixtures* (EPA 2003) for PAHs because there are no DEQ and EPA acute CMC criteria for these chemicals
- The Oak Ridge National Laboratory Tier II secondary acute ecological screening values for surface water for those ROD Table 17 chemicals that do not have DEQ, EPA, or equilibrium partitioning sediment benchmark values

In Specific Comment 21b (Appendix J) on the Combined DSR-PDIWP, EPA states, "For consistency with other project areas, include a comparison to chronic criteria for informational purposes. While

acute criteria are the appropriate screening criteria for water quality impacts from remedial action activities as they are short-term, limited releases, chronic criteria should also be included for comparison purposes.” Therefore, NW Natural will compare results to chronic criteria for informational purposes only (these data will not be used for decision-making during RD).

Results of the elutriate evaluations and associated recommendations for managing haul barge elutriate during dredging will be presented during RD.

5.3.1.2 Dredged Material Stabilization Testing

Dredged material stabilization tests will be performed on each of the 12 samples identified in Section 5.3.1 using Portland cement and potentially other pozzolanic materials (e.g., calciment, lime kiln dust) and material dosages to determine the appropriate amendment to cost-effectively stabilize dredge material so it meets the applicable transport and disposal facility material strength requirements. Stabilization will be performed using the same methodologies presented in the EPA-approved Gasco Sediments Site DGWP (Anchor QEA 2019a). A variety of dosages (and potentially amendment types) that may be used are described in the Second Phase PDI FSP (Appendix G). Optimum dosage ratios will be evaluated through paint filter testing, percent solids analysis, and visual observations of physical characteristics at specified cure periods (e.g., 24 hours, 48 hours, and 72 hours). The goal is to determine the most optimum combination of amendment, dosage ratio, and cure time to allow the stabilized end product to pass the paint filter test and meet the minimum structural strength required by the disposal facility.

5.3.1.3 Dredge Material Disposal Suitability Testing

Each of the 12 samples identified in Section 5.3.1 will be analyzed for the following parameters:

- Resource Conservation and Recovery Act (RCRA) waste characteristics (ignitability and corrosivity)
- Toxicity characteristic leaching procedure (TCLP) analytes (RCRA eight metals, VOCs, SVOCs, pesticides, and herbicides)

Extensive data have been collected throughout the Project Area for VOCs, which contain F002 waste constituents, as part of the capping demonstration subsurface sediment sampling program for the first phase PDI. The data were compared to DEQ risk-based concentrations for the five F002 waste constituents (TCE; cis-DCE; trans-DCE; 1,1-DCE; and vinyl chloride) included in the *Statement of Work – Gasco Sediments Site* (EPA 2009), and no exceedances were identified. No other available information indicates that F002 waste constituents would be present in the Project Area. For example, extensive testing within the immediately upstream Gasco Sediments Site Project Area has found no F002 constituent exceedances downstream of the Gasco/Siltronic property line. Therefore, NW Natural understands that F002 wastes are not present at the US Moorings Project Area and do not require further evaluation.

The RCRA waste characteristics will be defined based on 40 Code of Federal Regulations (CFR) 261.C. The TCLP elutriate concentrations will be compared against the TCLP criteria defined in 40 CFR 261.24.

Initially, each composite sample will be analyzed for the above parameters without any dewatering amendment. If no RCRA waste characteristics are identified and there are no exceedances of the TCLP thresholds, no additional testing will be performed. Alternatively, for any unamended samples that contain RCRA waste characteristics or exceedances of the TCLP thresholds, the samples will be stabilized with dewatering amendments and retested (only for the applicable tests driving the amendment addition).

NW Natural has confirmed that there are no disposal facility requirements to test for the reactivity characteristic.¹⁴ Instead, reactivity is designated based on generator knowledge. The eight criteria are listed below in **bold text** with NW Natural's knowledge in terms of each criterion in regular text.

1. **It is normally unstable and readily undergoes violent change without detonating.** The sediment is stable and would have violently changed by now if that was its inclination.
2. **It reacts violently with water.** The sediment is underwater and would have reacted violently with water if that was its inclination.
3. **It forms potentially explosive mixtures with water.** See response to criterion 2.
4. **When mixed with water, it generates toxic gases, vapors or fumes in a quantity sufficient to present a danger to human health or the environment.** The sediment is currently mixed with water. Numerous sediment investigations (AECOM and Geosyntec 2019; Anchor QEA 2010, 2020a; Integral 2004, 2005b, 2008; Integral and Anchor QEA 2005; Jacobs Engineering 2000; KTA/TEC 2010; URS 2003; Weston 1998) at various depths have been conducted in the Project Area with air quality monitoring, and there has been no evidence of toxic gases, vapors, or fumes.
5. **It is a cyanide or sulfide bearing waste which, when exposed to pH conditions between 2 and 12.5, can generate toxic gases, vapors, or fumes in a quantity sufficient to present a danger to human health or the environment.** There have been numerous sediment investigations at various depths throughout the Project Area with air quality monitoring, and there has been no indication that toxic gases, vapors, or fumes have been generated.
6. **It is capable of detonation or explosive reaction if it is subjected to a strong initiating source or if heated under confinement.** The sediment is not an explosive material and, to the best of NW Natural's knowledge, does not contain residues of explosives.
7. **It is readily capable of detonation or explosive decomposition or reaction at standard temperature and pressure.** See response to criterion 6.
8. **It is a forbidden explosive as defined in 49 CFR 173.54, or is a Division 1.1, 1.2, or 1.3 explosive as defined in 49 CFR 173.50 and 173.53.** See response to criterion 6.

¹⁴ There are no current test procedures for the reactivity characteristic. There were some reactivity tests that were used historically, but those test methods were withdrawn over 20 years ago.

6 Schedule and Reporting

NW Natural would like to complete the second phase PDI, following EPA approval of this Combined DSR-PDIWP, in spring 2023 to take advantage of relatively high river water surface elevations (highest during the March/early-April timeframe) to allow access to nearshore sediment sampling locations. NW Natural is currently working with contractors to determine an appropriate start date for the second phase PDI. The start date will be communicated to EPA at least 1 month in advance of mobilization.

Following completion of the second phase PDI and receipt of the final validated data, NW Natural will present the findings of the second phase PDI results. This report will include a detailed assessment of the data and determine if any data gaps remain to finalize SMA Refinement, CSM Refinement, or Remedial Technology Refinement. If there are data gaps, a proposed scope of work will be submitted to EPA in a PDIWP addendum after EPA feedback is received.

If no data gaps are identified to achieve the SMA Refinement, CSM Refinement, or Remedial Technology Refinement, NW Natural will submit for EPA review and approval the draft Pre-Design Investigation Evaluation Report within 90 days of receipt of the final validated second phase PDI data. The Pre-Design Investigation Evaluation Report will include the following content in accordance with the SOW (EPA 2020a) requirements:

- Summary of the investigations performed
- Summary of the investigation results
- Summary of validated data (i.e., tables and graphics)
- Data validation reports and laboratory data reports
- Narrative interpretation of data and results
- Results of statistical and modeling analyses, if applicable
- Photographs documenting the work conducted
- Conclusions and recommendations on whether the data are sufficient to complete the BODR

Field Change Request Summary

FCR No.	Date	Field Activity	FCR Title	FCR Description	Change
1	11/2/20	Subsurface Sediment Sampling	Subsurface Sediment Sampling Intervals for Alkylated PAH and TPH Analyses	As discussed in Section 5.4 of the EPA-approved PDIWP, NW Natural proposed analyses of alkylated PAHs and TPH at select subsurface sediment sample locations within the Project Area. The locations and intervals to be analyzed for these analyses are identified in Table B5-2 of Appendix B of the FSP. Six of these locations are in the ROD-identified Shallow Region of the Project Area and have sample depth intervals that are slightly different than the co-located capping evaluation sample intervals. The DQO for these analyses is to obtain alkylated PAH and TPH data throughout the majority of the core. To simplify the subsurface sediment processing in these six locations while achieving the DQO, NW Natural is proposing minor adjustments to the alkylated PAHs and TPH sampling intervals to be co-located with the capping evaluation sample intervals.	The locations and recommended sampling interval changes for alkylated PAHs and TPH are highlighted in yellow on the attached Table B5-2. At location USMPDI-020, the 2- to 4-foot sample interval will change to the 2- to 5-foot interval. At the other locations (USMPDI-024, USMPDI-025, USMPDI-029, USMPDI-032, and USMPDI-037), the sample interval will change from every 2 feet to 2 to 5 feet, 5 feet to 7 feet, 7 feet to 10 feet, and 10 feet to 13 feet.
2	3/24/21	Riverbank Angled Boring Collection	Angled Riverbank Boring Location Abandonment	As discussed in Section 6.4 of the EPA-approved PDIWP, NW Natural proposed the advancement of riverbank angled borings at 13 locations within the Project Area. The locations of the proposed borings are identified in Figure B3-3 of the FSP (Appendix B to the PDIWP). During the utility locate in preparation for boring advancement, utilities were identified adjacent to two of the proposed locations (USMPDI-065 and USMPDI-066) located in an alleyway between the top of riverbank and adjacent upland structures (Figure 1). The two locations were air-knifed to expose the utilities to further evaluate the possibility of safely advancing the borings at these locations (Attachment A). Neither location could safely be drilled at the proposed locations due to the utility conflicts and the lack of space needed to position the drill rig between the top of riverbank and the adjacent uplands structures. Just north of the target USMPDI-066 location, the building configuration would allow sufficient space for the drill rig to lay down the drill rig mast to advance a boring along the top of riverbank where no utility conflicts were identified. Repositioning USPDI-066 to this location would require a commensurate shift north by location USMPDI-065, but this shift would result in a spacing of approximately 80 feet to USMPDI-064 that is much less than the proposed 150 feet in the PDIWP. During the utility locate, a 12-foot tall timber bulkhead situated along the alignment shown in Figure 1 was identified that creates a physical barrier between the uplands and the riverbank adjacent to location USMPDI 070. An angled boring cannot be advanced in this location without penetrating the bulkhead, and advancing a vertical boring here would not achieve the data quality objective of characterizing the riverbank soil/sediment quality nor support the sediment remedy RD. USMPDI-069, the next boring to the north of this location, had to be adjusted south based on space restrictions and the presence of utilities. Relocating USMPDI-070 to the north to clear the timber bulkhead would position these borings approximately 50 feet apart, which is much closer than the proposed 150 feet in the PDWIP.	NW Natural proposes to abandon riverbank angled boring locations USMPDI-065 and USMPDI-070 due to the presence of utilities and timber bulkhead wall, respectively, and repositioning the locations to avoid these conflicts will result in a boring separation much closer than the proposed 150 feet and, therefore, unnecessary to support design. Consistent with Section 3.3.2 and Figure B3-2 of the FSP (Appendix B to the PDIWP), NW Natural will attempt to collect three-point composite surface (0 to 1 foot below ground surface) soil samples from the face of the riverbank at locations USMPDI-078 and USMPDI-083 adjacent to the proposed abandoned riverbank angled boring locations USMPDI-065 and USMPDI-070, respectively, to characterize the riverbank soil quality in these areas. If collecting the surface samples is not feasible, NW Natural will discuss with EPA whether additional data is necessary to support RD.

**Table 1-1
Field Change Request Summary**

FCR No.	Date	Field Activity	FCR Title	FCR Description	Change
3	4/1/21	Riverbank Surface Soil Collection	Riverbank Surface Soil Location Abandonment	<p>As discussed in Section 6.3 of the EPA-approved PDIWP, NW Natural proposed to collect riverbank surface (0 to 1 foot) soil for erodibility testing at 13 locations within the Project Area. The locations of the proposed surface soil locations are identified in Figure B3-2 of the FSP (Appendix B to the PDIWP) and were preliminarily identified at approximately 150-foot center across the entire Project Area riverbank pending any necessary repositioning during field sampling based on the encountered presence/absence of erodible soils.</p> <p>On March 29, 2021, Anchor QEA and EPA oversight personnel performed visual reconnaissance throughout the entire Project Area riverbank to document any presence of erodible soils (material less than 2 inches in diameter per Section 3.3.2 of the FSP) suitable to be collected for analysis. Representative photographs of the ground surface at each proposed location are included in the attached photograph log (Attachment A). As shown in the photograph log, nearly the entire riverbank is covered with large riprap and smaller gravels that are significantly larger than 2 inches in diameter, except for two small areas of the riverbank near locations USMPDI-073 and USMPDI-077. Anchor QEA successfully collected surface (0 to 1 foot) samples at both locations on March 30, 2021. The FSP-identified samples were to be collected as a composite of three grab samples in a triangular pattern with an equidistant spacing of approximately 25 feet around the proposed target location. However, field observations only indicated surface soils less than 2 inches in diameter in an approximately 10 foot by 10 foot area, so only two grab samples were collected at each location and homogenized into a composite sample for subsequent analysis in accordance with Section 5.2 of the FSP.</p>	<p>As verbally agreed with EPA oversight personnel during the visual reconnaissance, NW Natural proposes to abandon all riverbank surface soil locations other than USMPDI-073 and USMPDI-077 due to the lack of surface erodible soils, as photograph documented in Attachment A. In addition, due to the small area of potentially erodible solids at locations USMPDI-073 and USMPDI-077, a two-point composite grab sample was homogenized to create the sample at these locations, and the mid-point of the two samples will be used as the sampling location.</p>
4	5/4/21	Surface and Subsurface Sediment Sampling	Surface and Subsurface Station Abandonment and Modified Coring Approach for Remaining Shallow Stations	<p>Starting in September 2020 and continuing to date, NW Natural has been conducting PDI activities in the Project Area in accordance with the EPA-approved PDIWP. As discussed in Section 3.3 of the PDIWP, the surface sediment grabs are being collected and analyzed to refine the SMAs within the Project Area based on exceedances of the ROD Table 21 RALs and PTW-highly toxic thresholds. As shown in Figure 1, proposed station USMPDI-032 is in an area surrounded by stations USMPDI-026, USMPDI-033, USMPDI-037, USMPDI-029, and USMPDI-025. All of those stations are within 150 feet of their nearest neighbor, so the RD data density data quality objective in this area has been achieved. Therefore, NW Natural proposes to remove both surface and subsurface sampling at station USMPDI-032 from the PDI sampling program.</p> <p>As discussed in Section 6.2 of the PDIWP, NW Natural proposed to collect cores to a maximum depth of 16 feet bml or to refusal in the shallow region. Based on current and forecasted river surface water elevations and information gathered during the sampling over the last 2 weeks, four stations (USMPDI 028, USMPDI-030, USMPDI-031, and USMPDI-035; Figure 1) are located in the shallow embayment with insufficient river surface water elevations to allow collection of 16-foot subsurface cores using the PDI coring equipment. The sampling contractor's smaller boat is able to access this shallow area, but this boat is only capable of collecting cores to a maximum depth of 8 feet bml. Based on existing information from core stations collected during this PDI (e.g., USMPDI-005, USMPDI-015, and USMPDI-008) in similar nearshore locations but with greater water depth, it is unlikely that these four locations will have more than 8 feet of recoverable sediment before hitting a gravel/riprap layer that prevents deeper sampling. In addition, there is a single historical core collected from this area that was sampled down to 6 feet by the same marine contractor in 2008 with no identified sediment quality exceedances, and the current remedial technology identified in this area by the ROD is monitored natural recovery because no exceedances have been detected. For these reasons, NW Natural believes the feasible shorter core depth will achieve the necessary data quality objectives to complete RD in this area.</p>	<p>NW Natural proposes to remove station USMPDI-032 from the PDI sampling program due to sufficient data density in this area and to use an 8-foot coring assembly to collect stations USMPDI-028, USMPDI-030, USMPDI-031, and USMPDI-035 due to anticipated shallow refusal and insufficient river water surface elevations to collect the proposed 16 foot cores.</p>

Table 1-1
Field Change Request Summary

Notes:

BERA: *Final Baseline Ecological Risk Assessment*

bml: below mudline

COC: contaminant of concern

DQO: data quality objective

EPA: U.S. Environmental Protection Agency

FCR: Field Change Request

FSP: *Revised Final Field Sampling Plan*

PAH: polycyclic aromatic hydrocarbon

PCB: polychlorinated biphenyl

PDI: pre-design investigation

PDIWP: *Revised Final Pre-Design Investigation Work Plan*

Project Area: US Moorings Project Area

PTW: principal threat waste

RAL: remedial action level

RD: remedial design

REV: reference envelope value

ROD: Record of Decision

SEF: Sediment Evaluation Framework

SMA: sediment management area

TPH: total petroleum hydrocarbon

	Analytical Method	Site-Wide RAL	PTW Threshold	USMPDI-051SG-201009	USMPDI-052SG-201008	USMPDI-053SG-201008	USMPDI-054SG-201009	
				Sample Date	10/9/2020	10/8/2020	10/8/2020	10/9/2020
				Depth	0 - 11.5 in	0 - 10.7 in	0 - 9.8 in	0 - 10 in
				Sample Type	N	N	N	N
				Easting	7622979.42	7623020.615	7623083.692	7623185.223
				Northing	706081.454	706134.807	706166.477	706260.708
Conventional Parameters (unitless)								
Liquid limit	D4318			--	--	--	--	
Plastic limit	D4318			--	--	--	--	
Plasticity index	D4318			--	--	--	--	
Specific gravity	D854			--	--	--	--	
Conventional Parameters (mg/kg)								
Cyanide	D7511-12			28.7	114 J	432 J	303	
Conventional Parameters (pct)								
Moisture (water) content	D2216			--	--	--	--	
Total organic carbon	SM5310BM			3.2	3.2	4.3	3	
Total Solids	SM2540G			36.3	37.6	47.3	38.8	
Conventional Parameters (lb/ft³)								
Density (bulk)	D7263			--	--	--	--	
Density (dry)	D7263			--	--	--	--	
Grain Size (pct)								
Gravel	D6913			--	--	--	--	
Sand	D6913			--	--	--	--	
Total fines (Reported, not calculated)	D6913			--	--	--	--	
Percent passing 0.5 inch (1/2 inch sieve)	D6913			--	--	--	--	
Percent passing 0.375 inch (3/8 inch sieve)	D6913			--	--	--	--	
Percent passing 4750 micron sieve (#4)	D6913			--	--	--	--	
Percent passing 2000 micron sieve (#10)	D6913			--	--	--	--	
Percent passing 110 micron sieve (#140)	D6913			--	--	--	--	
Percent passing 850 micron sieve (#20)	D6913			--	--	--	--	
Percent passing 425 micron sieve (#40)	D6913			--	--	--	--	
Percent passing 250 micron sieve (#60)	D6913			--	--	--	--	
Percent passing 150 micron sieve (#100)	D6913			--	--	--	--	
Percent passing 75 micron sieve (#200)	D6913			--	--	--	--	
Semivolatile Organics (µg/kg)								
Benzo(b)naphtho(2,1-d)thiophene	SW8270ESIM			151	355 J	5820 J	--	
Biphenyl (1,1'-Biphenyl)	SW8270ESIM			12.7 J	47.1 J	1350 J	--

Data Summary: Surface Sediment

	Location ID			USMPDI-053SC-A
	Sample ID			USMPDI-053SC-A-00-01-210428
	Sample Date			4/28/2021
	Depth			0 - 1 ft
	Sample Type			N
	Easting			7623087.082
	Northing			706162.7031
	Analytical Method	Site-Wide RAL	PTW Threshold	
Total Petroleum Hydrocarbons (mg/kg)				
Diesel range hydrocarbons	NWTPHDx			546
Motor oil range hydrocarbons	NWTPHDx			770

Table 4-1a
Data Summary: Surface Sediment

Notes:

1. Select samples were analyzed for alkylated PAHs using SW8270ESIM.

 Detected concentration is greater than the site-wide RAL

 Detected concentration is greater than the PTW threshold

Bold: Detected result

µg/kg: microgram per kilogram

J: Estimated value

JT: Estimated value (calculated result)

PCB: polychlorinated biphenyl

PH: Portland Harbor

PTW: principal threat waste

RAL: remedial action level

ROD: *Record of Decision – Portland Harbor Superfund Site, Portland, Oregon*

T: Calculated or averaged result

U: Compound analyzed for, but not detected above detection limit

UT: Compound analyzed for, but not detected above detection limit (calculated result)

UJ: Compound analyzed for, but not detected above estimated detection limit

UJT: Compound analyzed for, but not detected above estimated detection limit (calculated result)

Total Petroleum Hydrocarbons (mg/kg)							
Diesel range hydrocarbons	NWTPHDx			61.1 U	134 U	166	133
Motor oil range hydrocarbons	NWTPHDx			122 U	267 U	428	257 U

Notes:

 Detected concentration is greater than the Navigation Channel RAL

 Detected concentration is greater than the PTW threshold

Bold: Detected result

µg/kg: microgram per kilogram

J: Estimated value

JT: Estimated value (calculated result)

PCB: polychlorinated biphenyl

PH: Portland Harbor

PTW: principal threat waste

RAL: remedial action level

ROD: *Record of Decision – Portland Harbor Superfund Site, Portland, Oregon*

T: Calculated or averaged result

U: Compound analyzed for, but not detected above detection limit

UT: Compound analyzed for, but not detected above detection limit (calculated result)

UJ: Compound analyzed for, but not detected above estimated detection limit
