I. INTRODUCTION

Q: Please state your name and business address.

A: My name is Scott Norwood. I am President of Norwood Energy Consulting, L.L.C. My business address is 9408 Bell Mountain Drive, Austin, Texas 78730.

Q: By whom are you employed and in what capacity?

A: I am a self-employed energy consultant specializing in the areas of electric utility regulation, resource planning and energy procurement.

Q: On whose behalf are you testifying?

A: I am testifying on behalf of the Public Counsel Section of the Washington Attorney General’s Office (Public Counsel) and the Industrial Customers of Northwest Utilities (ICNU).

Q: Please describe your professional qualifications.

A: I have over 30 years of experience in the electric utility industry. After graduating from the University of Texas in 1980 with a Bachelor of Science degree in electrical engineering, I began my career as a power plant engineer for the City of Austin’s Electric Utility Department where I was responsible for electrical maintenance and design projects for the City’s three gas-fired power plants. In January 1984, I joined the staff of the Public Utility Commission of Texas as Manager of Power Plant Engineering. In that capacity I was responsible for addressing resource planning, fuel and purchased power cost issues presented in regulatory filings before the Texas Commission. In 1986, I joined GDS Associates, Inc., a Marietta, Georgia-based consulting firm that specializes in electric utility regulatory consulting and resource planning. I was elected a

1 Principal of GDS in 1990 and directed the firm's Deregulation Services
2 Department until January 2004, when I formed Norwood Energy Consulting,
3 LLC. The focus of my current consulting practice is energy planning,
4 procurement and regulation.¹

5 **Q: Have you previously filed testimony before the Washington Utilities &**
6 **Transportation Commission?**

7 A: Yes. I presented testimony on behalf of Public Counsel addressing various power
8 supply issues including PSE's development plans for the Lower Snake River
9 (LSR) wind project in WUTC Docket Nos. UE-090704/UG-09705, Puget Sound
10 Energy's (PSE) 2009 general rate case. In addition, I filed testimony on behalf of
11 Public Counsel in WUTC Docket No. UE-070725, involving PSE's ratemaking
12 proposal for crediting renewable energy credit (REC) sales proceeds to customers.
13 I have also testified on behalf of consumers, government agencies, and consumer-
14 owned utilities in numerous past regulatory proceedings before state regulatory
15 commissions in Arkansas, Georgia, Illinois, Iowa, Louisiana, Michigan, Missouri,
16 New Jersey, Oklahoma, Texas, Virginia and Wisconsin.

17 **Q: What is the purpose of your testimony?**

18 A: The purpose of my testimony is to present my analysis and recommendations
19 regarding the prudence of PSE's investment in the Lower Snake River Phase 1
20 (LSR 1) wind generation facility.

21

¹ See Exhibit No. SN-2 for a more detailed summary of my background and experience.

1 **Q: What exhibits are you sponsoring in this proceeding?**

2 **A:** In addition to my testimony, I am sponsoring 12 exhibits as attachments. Exhibit
3 Nos. SN-2 through SN-13 are described in the Exhibit List at the beginning of my
4 testimony.

5 **II. SUMMARY OF TESTIMONY**

6 **Q: Please summarize your major findings and recommendations.**

7 **A:** In this case PSE seeks to recover approximately \$158 million for its \$848 million
8 discretionary investment in the LSR 1 wind generation project.² The LSR 1
9 project is not necessary to meet PSE's Renewable Portfolio Standard requirements
10 (RPS requirements) associated with the Energy Independence Act³ until 2018 or
11 later and, and would produce a level of renewable energy that significantly
12 exceeds the Company's RPS requirement through 2020. The cost of wind energy
13 from the LSR 1 project requested in this case is approximately \$139/MWh
14 (including the Treasury Grant credit), which is approximately **[Begin**
15 **Confidential]** **XX** **[End Confidential]** times PSE's forecasted rate year price for
16 market energy purchases.⁴

17 PSE's primary justification for the project appears to be the Company's
18 desire to take advantage of a Federal Treasury Grant that is available for wind
19 projects that are completed by the end of 2012. However, this grant is only an
20 advantage for early wind⁵ additions such as LSR 1 if wind production tax credits

² Exhibit No. SN-3; PSE Response to Public Counsel Data Request No. 40.

³ RCW 19.285 et seq.

⁴ See Exhibit No. SN-4.

⁵ Unless otherwise indicated by the context, the terms "early wind" or "early" should be read as meaning "before needed to meet the RPS requirements of the Energy Independence Act."

1 (PTCs), which have almost continuously been in effect since 1992, are terminated
2 and not available for projects added after 2012, as the Company's analysis
3 assumes. Moreover, as shown in Figure 1, PSE's analysis of the cost
4 effectiveness of early wind additions indicates that early wind additions are
5 significantly more costly than postponing wind additions until needed to meet
6 RPS requirements in all 14 scenarios evaluated over the next 10 years and in 7 of
7 14 scenarios over the next 20 years.

8 **Figure 1 - Early Wind Benefits/(Cost) vs. No Early Wind⁶**
9 **(NPV \$1000s)**

10 **[Begin Confidential]**

26 **[End Confidential]**

27 As discussed in my testimony, PSE's analysis of the cost effectiveness of
28 early wind additions as reflected in Figure 1, did not consider rate impacts on
29

⁶ Calculations based on PSE Response to Public Counsel Data Request No. 345, Att. B.

1 customers, and is seriously flawed by a number of other major errors and extreme
2 assumptions that overstate the estimated benefits of early wind additions,
3 including:

4 1) PSE, by mistake, failed to use the proper market energy price forecast
5 for all of the Business as Usual (BAU) scenarios and thereby overstated
6 the benefit of adding renewable energy before it was necessary by
7 approximately **[Begin Confidential]** XXXXXXXX **[End Confidential]** on
8 a present value basis;

9 2) PSE's failure to consider the REC banking provisions of Washington's
10 RPS statute in its analysis of early wind additions overstated the level of
11 renewable energy needed to meet RPS requirements, which in turn
12 overstated the Company's estimate of early wind benefits by
13 approximately **[Begin Confidential]** XXXXXX **[End Confidential]**;

14 3) PSE unreasonably assumed that wind PTCs would no longer be
15 available for new projects placed in service after 2013 in all scenarios
16 evaluated, despite the fact that PTCs have been available almost
17 continuously for the last 20 years. This extreme assumption overstated the
18 benefit of the early wind addition for capacity equivalent to LSR 1 by
19 approximately \$228 million on a present value basis;

20 4) The Company used an outdated and overstated carbon price forecast
21 for the analyses, thereby overstating the estimated benefits of early wind
22 additions by approximately \$99 million;

1 5) PSE improperly calculated and relied upon "end effects" associated
2 with new wind energy resources in all scenarios evaluated, thereby
3 overstating the benefits of early wind additions by approximately **[Begin**
4 **Confidential]** **XXXXXXX** **[End Confidential]**; and

5 6) PSE failed to evaluate REC purchases as a potential low cost
6 alternative to constructing new wind generation in its analysis of the cost-
7 effectiveness of early wind additions. This flaw served to overstate the
8 estimated benefit of early wind additions by approximately **[Begin**
9 **Confidential]** **XXXXXXX** **[End Confidential]** assuming PSE could have
10 purchased RECs to supply its projected RPS shortfalls in 2018, 2019 and
11 2020.

12 With even modest adjustments to correct the flaws in PSE's early wind analysis as
13 noted above, the cost advantage of postponing wind additions until needed to
14 meet RPS requirements, as compared to early wind additions, is overwhelming.
15 Moreover, there are significant rate impacts of the LSR 1 project which do not
16 appear to have been considered in PSE's decision process. For example, as shown
17 below in Figure 2, over the next four years the average cost increase for all early
18 wind scenarios evaluated by PSE was approximately **[Begin Confidential]** **XXX**
19 **XXXX** **[End Confidential]** per year when compared to the "No Early Wind"
20 option.

21

1 **Figure 2 - Forecasted Benefit/(Cost) of Early Wind Scenarios (\$1000s)⁷**

10
11
12
13
14
15
16
17
18
19

20 **[End Confidential]**

21
22 In fact, because LSR 1 represents the vast majority of the total electric rate
23 increase requested by PSE in this case, it is likely that the increase proposed by
24 the Company in this case could have been totally avoided if PSE had simply
25 postponed this project until it was needed to meet RPS requirements. Such a
26 postponement would have been prudent particularly in the tough economic
27 climate that existed when PSE made its decision to proceed with LSR 1, and
28 which continues to exist at this time.

29 For these and other reasons explained in my testimony, I believe that
30 PSE's \$848 million investment in LSR 1 was imprudent and unnecessary and that
31 the plant will not be used and useful when placed in service early next year.

32 Accordingly, I recommend that the revenue requirement requested by PSE in this

⁷ Calculations based on PSE Response to Public Counsel Data Request No. 345, Att. B.

1 case for its LSR 1 investment be reduced by \$55 million, **[Begin Confidential]**

2 **XX**

3 **XX**

4 **XX**

5 **XXXXXXXXXX [End Confidential]** and reflected in my Figure 2. While the
6 actual cost impact on customers of PSE's LSR 1 investment is much larger than
7 my recommended disallowance, my disallowance conservatively reflects the
8 estimated additional cost expected to be incurred due to early wind additions
9 based on the Company's estimates at the time the decision was made to select
10 LSR 1. My recommendation allows PSE to recover requested operations and
11 maintenance costs, depreciation, property taxes, insurance, and related wheeling
12 and wind integration costs, and debt financing costs for the project, plus a modest
13 return on equity. Although my recommendation does not fully hold PSE's
14 customers harmless from PSE's imprudent decision to construct LSR 1 early, it
15 does provide a more reasonable sharing of the additional near-term costs incurred
16 as a result of the Company's imprudent decision to proceed with this discretionary
17 and costly project.

18 **III. LOWER SNAKE RIVER WIND PROJECT**

19 **Q: Please describe PSE's LSR 1 wind generation project.**

20 A: The LSR 1 project is a 342.7 megawatt (MW) wind generation facility under
21 construction by PSE near the town of Pomeroy in southeast Washington. LSR 1
22 will consist of 149 wind turbines, each rated at 2.3 MW. The current expected in-

1 service date of the LSR 1 project is mid-February 2012, with final completion
2 estimated for mid-August 2012.⁸

3 **Q: What is the total estimated capital cost of the LSR 1 project?**

4 **A:** The total estimated capital cost of the LSR 1 facility and associated transmission
5 costs is approximately \$848 million, which equates to \$2,475/kW.⁹

6 **Q: Does the cost of the LSR 1 project represent a significant component of the**
7 **overall electric rate increase requested by PSE in this case?**

8 **A:** Yes. PSE is requesting a \$152.9 million (8.13 percent) electric general rate
9 increase in this case. As noted in the direct testimony of PSE's President and
10 Chief Executive Officer, Kimberly Harris, LSR 1 is the largest single cost factor
11 contributing to the increase in electric rates requested in this case.¹⁰ In fact, the
12 requested general rate revenue requirement for the LSR 1 project is approximately
13 \$158 million.¹¹

14 **Q: When did PSE initiate its planning to develop the LSR wind project?**

15 **A:** PSE acquired its initial 50 percent development rights in the LSR wind project in
16 November of 2008,¹² in the middle of the global financial crisis. The PSE Board
17 approved the Company's acquisition of the remaining 50 percent of the LSR
18 project development rights from RES America Developments Inc. in July of
19 2009.¹³

⁸ PSE Response to Staff Data Request No. 156.

⁹ Exhibit No. RG-1HCT, p. 74 (Garratt Direct Testimony).

¹⁰ Exhibit No. KJH-1T, p. 5 (Harris Direct Testimony).

¹¹ See Exhibit No. SN-3. This amount excludes the Treasury Grant which credits which will be recovered through a separate tariff, and \$33.6 million in related estimated energy savings.

¹² Exhibit No. RG-1HCT, p. 30 (Garratt Direct Testimony).

¹³ Exhibit No. RG-1HCT, p. 30 (Garratt Direct Testimony).

1 **Q: Will LSR 1 be directly interconnected with PSE's transmission system?**

2 A: No. The LSR 1 project will be interconnected to the Bonneville Power
3 Administration's (BPA) transmission system at the new Central Ferry 230/500 kV
4 substation, under terms of a Large Generator Interconnection Agreement between
5 PSE and BPA.¹⁴ Energy produced by LSR 1 will be placed in the BPA Balancing
6 Authority and subject to BPA's Integration Tariff, which is currently \$16.26/kW
7 per year.¹⁵ BPA has granted PSE firm transmission rights for the first 250 MW of
8 LSR 1, and PSE plans to purchase conditional firm transmission service for the
9 remaining output of the project until July of 2013, when BPA is expected to have
10 completed the necessary upgrades to provide firm transmission service for the
11 entire output of the plant.¹⁶

12 **Q: Why is PSE constructing the LSR 1 wind generation project at this time?**

13 A: PSE indicates that its decision to construct LSR 1 at this time is in large part to
14 meet the Washington renewable portfolio standard (RPS) which requires that the
15 Company serve at least 9 percent of its electric load with renewable resources by
16 2016.¹⁷ Although the Company has adequate renewable resources to meet RPS
17 requirements through 2016 or later, the Company asserts that current government
18 incentives make near-term acquisition of renewable resources a more cost-
19 effective alternative for PSE and its customers.¹⁸ In fact, PSE states that federal

¹⁴ Exhibit No. RG-1HCT, p. 72 (Garratt Direct Testimony).

¹⁵ Exhibit No. RG-1HCT, p. 74 (Garratt Direct Testimony).

¹⁶ *Id.*

¹⁷ Exhibit No. RG-1HCT, p. 3 (Garratt Direct Testimony).

¹⁸ Exhibit No. RG-1HCT, p. 19 (Garratt Direct Testimony).

1 tax incentives are the "key driver" behind its decision to add LSR 1 at this time in
2 order to meet its 2016 RPS requirement.¹⁹

3 **Q: What was PSE's decision process supporting its selection of the LSR 1**
4 **facility?**

5 **A:** PSE's decision process leading to selection and development of the LSR 1 wind
6 project is generally described on pages 13-17 of the direct testimony of PSE
7 witness Garratt. Essentially, the decision process began with PSE's 2009 IRP
8 analysis, in which the Company identified a need for approximately 81 average
9 megawatts (aMW) of new renewable generation by 2016 in order to comply with
10 the Washington RPS requirement that the Company supply 9 percent from
11 renewable resources by that year.²⁰ The Company asserts that its 2009 IRP
12 analysis demonstrated that it would be cost effective to add 300 MW of new wind
13 generation by 2012, plus another 300 MW of new wind generation by 2016.²¹

14 Based on this determination, PSE issued its 2010 Request for Proposals
15 (RFP) on January 12, 2010, seeking approximately 1,000 MW of new electric
16 resources, including 600 MW of new wind generation, by 2016.²² After
17 conducting a two-phased analysis of the economic and other attributes of wind
18 energy proposals it received in response to the 2010 RFP, PSE staff identified
19 LSR 1 as the lowest reasonable cost and lowest risk renewable resource option to
20 meet its identified renewable resource need.²³ On May 5, 2010, PSE's Board of

¹⁹ Exhibit No. RG-1HCT, p. 20 (Garratt Direct Testimony).

²⁰ Exhibit No. RG-1HCT, p. 12 (Garratt Direct Testimony).

²¹ *Id.*

²² *Id.*

²³ Exhibit No. RG-1HCT, p. 57 (Garratt Direct Testimony).

1 Directors approved PSE's Energy Management recommendation to construct the
2 LSR 1 wind generation project.²⁴

3 **Q: What specific relief is PSE requesting for its LSR 1 investment in this case?**

4 **A:** PSE is seeking a determination that its decision to construct the LSR 1 project
5 was prudent.²⁵ PSE is also requesting that the Commission approve its proposed
6 \$158 million general rate revenue requirement for the LSR 1 project.²⁶

7 **Q: What are the key issues raised by PSE's LSR 1 project?**

8 **A:** PSE's decision to invest \$848 million for the LSR 1 wind project in the middle of
9 a global economic crisis, years before the plant was needed to meet RPS
10 requirements, raises a number of serious issues regarding the prudence of the
11 investment, the extent to which the project is used and useful, and whether PSE
12 reasonably considered alternatives to mitigate the rate impact of this discretionary
13 project on its customers

14 **IV. STANDARDS FOR REVIEW OF LSR 1 PROJECT**

15 **Q: What standards have you applied in evaluating PSE's request for decision to**
16 **construct LSR 1?**

17 **A:** I have applied the standards described by the Commission in its January 3, 2011,
18 *Renewable Resource Policy Report*.²⁷ In the *Renewable Resource Policy Report*,
19 the Commission notes that it must make two basic determinations when

²⁴ Exhibit No. RG-1HCT, p. 57(Garratt Direct Testimony).

²⁵ Exhibit No. RG-1HCT, p. 2 (Garratt Direct Testimony).

²⁶ Exhibit No. SN-3.

²⁷ *In the Matter of the Washington Utilities and Transportation Commission Inquiry on Regulatory Treatment For Renewable Energy Resources*, Report and Policy Statement Concerning Acquisition of Renewable Resources by Investor-Owned Utilities (*Renewable Resource Policy Report*), Docket No. UE-100849, June 3, 2011.

1 evaluating applications for approval of utility resource acquisitions: first, whether
2 the acquisition was "prudent," and second, whether the resource was "used and
3 useful" as required by RCW 80.04.250.²⁸ In its 1994 *Puget Prudence Order*, the
4 Commission articulated the standard it would apply in determining prudence of
5 generating resource investments, as follows:

6 The company must establish that it adequately studied the
7 question of whether to purchase these resources and made a
8 reasonable decision, using the data and methods that a
9 reasonable management would have used at the time the
10 decisions were made.²⁹

11
12 The prudence standard adopted in prior Commission orders
13 is easily applied to any resource decision, whether it is to
14 build or to purchase. The utility must first determine
15 whether new resources are necessary. Once a need has
16 been identified, the utility must determine how to fill that
17 need in a cost effective manner. When a utility is
18 considering purchase of a resource, it must evaluate that
19 resource against the standards of what other purchases are
20 available, and against the standard of what it would cost to
21 build the resource itself.³⁰

22
23 In the *Renewable Resource Policy Report*, the Commission describes the
24 standard that has been applied in Washington to determine whether

25 / /

26 / / /

27 / / / /

²⁸ *Renewable Resource Policy Report*, ¶ 26.

²⁹ *WUTC v. Puget Sound Power & Light*, Docket Nos. UE-920433, UE-920499, UE-921262, (consolidated), Nineteenth Supplemental Order at 10 (Sept. 27, 1994) (*Puget Prudence Order*).

³⁰ *Id.* at 11.

1 generating resource investments are "used and useful" as follows:

2 Both common sense and hornbook utility
3 law support our conclusion that RCW
4 80.04.250 requires a resource to be
5 "employed in accomplishing something ...
6 beneficial" for Washington ratepayers ("in
7 this state"), before they can be required to
8 pay for it. Our Order allows these benefits
9 to be direct or indirect, tangible or
10 intangible, as long as they are reasonably
11 quantifiable and commensurate with their
12 costs.³¹

13
14 As stated by the state Supreme Court in the *POWER*
15 case: "'Used' is defined as 'employed in
16 accomplishing something'; 'useful' is defined as
17 'capable of being put to use: having utility:
18 advantageous: producing or having the power to
19 produce good: serviceable for a beneficial end or
20 object.'"³²

21
22 **Q: Did the Commission provide further guidance regarding the application of**
23 **the prudence and used and useful standards to renewable resource**
24 **investments in its *Renewable Resource Policy Report*?**

25 A: Yes the Commission outlined the standards it would apply in evaluating the
26 prudence and used and usefulness of renewable resources, such as LSR 1, that: (1)
27 are acquired by utilities in advance of the RPS deadlines established under the

³¹ *Renewable Resource Policy Report*, ¶ 31, quoting *WUTC v. PacifiCorp d/b/a Pacific Power & Light Company, In the Matter of the Petition of PacifiCorp for an Order Approving Deferral of Costs Related to Declining Hydro Generation*, Order 06, Docket No. UE-050684, Order 05, Docket No. UE-050412, Order 02, Docket No. UE-060669, ¶ 27 (July 14, 2006) (footnote omitted).

³² *Id.*, quoting *People's Organization for Washington Energy Resources v Washington Utilities & Transp. Comm'n*, 101 Wn.2d 425, 430, 649 P.2d 425 (1984) (*POWER*), citing *Webster's Third New International Dictionary* 2524 (1976).

1 EIA, or (2) that supply renewable energy at levels that exceed the established RPS
2 targets.³³

3 As discussed in the following sections of my testimony, I have applied the
4 above standards in my evaluation of the extent to which PSE's investment in the
5 LSR 1 project was prudent and used and useful.

6 **V. PRUDENCE OF LSR 1 ADDITION**

7 **Q: Which of the above prudence standards apply in the case of LSR 1?**

8 **A:** As discussed above, the Commission's prudence standard requires that the utility
9 demonstrate that new resources are necessary and that such resources are cost
10 effective when compared to other available resource alternatives.

11 **Q: What evidence has PSE presented to support the prudence of its LSR 1
12 acquisition?**

13 **A:** PSE witnesses Garratt and Seelig are the primary witnesses that address the
14 prudence of the Company's decision to construct the LSR 1 facility. Generally,
15 the direct testimonies of these witnesses describe the resource planning,
16 competitive procurement and management decision making processes which
17 culminated in PSE's decision in May of 2010 to construct the LSR 1 facility.

18 **Q: Does the evidence presented by PSE demonstrate that the Company's
19 investment in LSR 1 was prudent?**

20 **A:** No. As discussed in the following sections of my testimony, it was not necessary
21 for PSE to construct LSR 1 at this time in order to meet the Company's RPS

³³ *Renewable Resource Policy Report*, ¶¶ 51-57 (in advance of need); ¶¶ 58-64 (in excess of need).

1 requirements, and the LSR 1 project is much more costly than other available
2 generating resource alternatives.

3 **A. Economic Climate and Rate Impacts.**

4 **Q: What were the economic conditions at the time PSE was conducting the**
5 **analysis which led to its decision to construct the LSR 1 wind project?**

6 A: The economic conditions at the time PSE prepared its 2009 IRP analysis reflected
7 high unemployment, decreasing energy prices, decreasing electric demand and
8 great economic uncertainty due to continuing effects of the global financial crisis
9 which occurred in late 2008. This great economic uncertainty created significant
10 challenges for PSE in deciding timing of new resource additions, as described in
11 PSE's 2009 IRP:³⁴

12 Economic conditions have changed considerably since work began on this
13 IRP in the summer of 2007. At that time, uninterrupted growth was
14 generally forecast for the U.S. economy, and the Pacific Northwest in
15 particular. Worldwide appetite for energy was strong and increasing.
16 Commodity prices – including oil, natural gas, and even coal –
17 experienced a period of demand-induced speculation that drove prices to
18 unprecedented highs. During 2008, economic conditions changed
19 drastically. Major global banking institutions failed and others struggled
20 to maintain solvency even with government help. The speculative bubble
21 in commodity prices burst, driving prices to lows that are probably not
22 realistic over the long term. By March 2009, the forecast for U.S. GDP
23 growth had fallen to -3.7% for 2009 and 1.5% for 2010, with
24 unemployment projected at more than 10% for 2010. Although many
25 forecasts point to a recovery in 2011 or 2012, there is still little evidence
26 to indicate when conditions might improve, or what that improvement
27 might look like.

28
29 These conditions are having a variety of effects on long-term resource
30 planning and acquisition.

³⁴ Exhibit No. RG-3, p. 2-2. (Emphasis in original).

1 *Most immediately, uncertainty about future economic conditions affects*
2 *PSE's ability to project energy demand. How much energy customers will*
3 *require in coming years depends a great deal on economic activity; factors*
4 *like employment and population growth are extremely important to*
5 *calculating resource need. The wide range of demand forecasts modeled*
6 *for this IRP analysis reflects how much conditions have changed since*
7 *mid-2007. The challenge this presents is one of timing. Resources take*
8 *time to develop, and should demand increase quicker than expected, the*
9 *portfolios could be exposed to a greater reliance on spot markets at a time*
10 *when demand and prices are high.*
11

12 **Q: Did PSE adequately account for the great economic uncertainty which**
13 **existed at the time it was making its decision to construct LSR 1?**

14 A: No. As discussed later in my testimony, PSE's analysis supporting its decision to
15 construct LSR 1 years before it was needed failed to adequately consider the
16 economic uncertainty and its impact on key variables that impacted the cost-
17 effectiveness of LSR 1. These key variables included the level of future energy
18 prices, the potential for continuation of PTCs, and assumptions regarding the
19 timing and cost of carbon regulations. Moreover, it appears that the Company
20 virtually ignored the significant customer rate impacts of adding new wind
21 generation early. Indeed, virtually every scenario evaluated by the Company
22 indicated that the cost of adding new wind energy early would be significantly
23 higher than adding wind later over the next 10 to 20 years.

24 **Q. Is there any evidence that PSE considered the ratepayer impact of its LSR 1**
25 **proposal in reaching its decision to construct the project?**

26 A: No. PSE President Kimberly Harris spends significant time in her direct
27 testimony describing the actions the company has taken to mitigate the rate

1 increase requested in this case in light of the difficult economic conditions faced
2 by its customers. Notably, however, the Company's testimony barely mentions
3 that the rate increase in this case is almost entirely attributable to its decision to
4 construct LSR 1 at least 6 years before it was needed to meet RPS requirements.
5 For example, PSE witness Susan McClain's testimony is devoted entirely to
6 addressing PSE's cost control measures and major factors impacting PSE's costs
7 and leading to the rate increase requested in this case, yet fails to mention the
8 Company's \$848 million investment in the LSR 1 project and the large impact this
9 project has on the rate increase. None of the economic analyses provided by PSE
10 to support its decision to construct the LSR 1 project explicitly addresses the
11 ratepayer impact of this project, or compares the rate impact of LSR 1 to other
12 alternatives such as adding wind later when needed to meet RPS requirements.

13 **Q: Should PSE have been aware that its customers were very concerned**
14 **regarding the rate impact of the LSR 1 project before it made its decision to**
15 **proceed with the project in May of 2010?**

16 A: Yes. PSE should have been aware that its customers would be concerned about
17 any new electric rate increases, and particularly about rate increases resulting
18 from large discretionary capital investments such as the LSR 1 project, which
19 offer no near-term benefits. In PSE's 2009 general rate case, the Company
20 included information regarding its plans to construct the first 250 MW of the LSR
21 project in 2011. In response, I filed direct testimony on behalf of Public Counsel
22 on November 17, 2009, expressing serious concerns regarding the cost of the LSR
23 wind project and questioning the prudence of PSE's apparent plans to add this

1 project before it was needed to meet RPS requirements. My testimony included
2 the following statement:

3 Wind generation projects are non-dispatchable, non-firm energy resources,
4 and the cost of energy delivered from PSE's new wind projects is
5 approximately 3 to 4 times the current market price of purchased energy.
6 Given these facts, it does not appear it would be prudent for PSE to
7 proceed with the development of any new wind generation projects until
8 such projects are needed to meet the Company's RPS requirements, or are
9 otherwise justified by economic benefits to customers when compared to
10 available resource alternatives.³⁵
11

12 **Q: What rationale did PSE provide in the Company's 2009 rate case for its plan**
13 **to add LSR 1 in 2011?**

14 A: The Company indicated that the addition of new wind capacity at the LSR project
15 was intended to meet PSE's corporate goal of supplying 10 percent of its system
16 load with renewable energy by 2013.³⁶ It is important to note that this testimony
17 was filed in May 8, 2009, approximately five months before PSE had conducted
18 the rerun of its 2009 IRP to assess the cost effectiveness of early wind additions
19 and approximately one year before the Company completed its RFP process or
20 received final Board of Directors approval to go forward with the LSR project.

21 **Q: Did PSE conduct economic analyses to assess the costs and benefits of adding**
22 **new wind generation before it was needed to meet RPS requirements?**

23 A: Yes. PSE conducted economic analyses in the fall of 2009 to address the cost
24 effectiveness of adding new wind generation early.³⁷ As discussed later in my

³⁵ Exhibit No. SN-13, p. 4 (Excerpt from Direct Testimony of Scott Norwood, *WUTC v. PSE*, Docket Nos. UE-090704, UG-090705 (*PSE 2009 GRC*), Exhibit No. SN-1T (redacted)(The excerpt contains the complete testimony section entitled "PSE's Wind Development Strategy").

³⁶ *PSE 2009 GRC*, Exhibit No. RG-1HCT, page 97 (Garratt Direct Testimony).

³⁷ Exhibit No. AS-1HCT, pp. 19-21 (Seelig Direct Testimony).

1 testimony, these analyses included a number of errors and extreme assumptions
2 which unreasonably biased the results to overstate estimated benefits of early
3 wind additions. However, as shown in my Figure 1, even with these flaws, the
4 Company's analyses of the cost effectiveness of early wind additions, indicated
5 that early wind additions, such as LSR 1, would be much more expensive than the
6 "No Early Wind" alternative in all 14 scenarios evaluated over the next ten years.
7 Early wind was also more expensive in 7 of 14 scenarios evaluated over the next
8 20 years. In essence, the Company's analyses indicated that the early addition of
9 new wind projects such as LSR 1 would not benefit customers at all for the next
10 10 years, and likely not for the next 20 years.

11 The results in Figure 1 reflect the Company's "Re-run" of the 2009 IRP
12 analysis of the cost-effectiveness of early wind additions, as recently corrected by
13 PSE to reflect an error in the market prices used for the "2009 BAU" scenario.
14 The nature of this Company error is discussed in more detail later in my
15 testimony. It is important to note, however, that even before correcting this
16 market price error, PSE's original analysis of the cost-effectiveness of early wind
17 additions indicated that all early wind addition scenarios were significantly more
18 costly than the No Early Wind scenario over the next five to ten years.³⁸

19 **Q: Was it prudent for PSE to ignore the fact that its own analyses indicated that**
20 **early wind additions such as the LSR 1 project would not benefit customers**
21 **for 20 years or more?**

³⁸ Exhibit No. SN-5.

1 A: No. It is always important for utilities to consider customer benefits as a primary
2 factor when evaluating major investments. However, given the tough economic
3 climate, the uncertainty that existed regarding its cost/benefit analysis for new
4 wind additions, and the discretionary nature of the \$848 million LSR 1
5 investment, it was particularly important for PSE to consider whether there
6 was sufficient estimated economic benefit of early wind energy to justify its
7 proposed LSR 1 project.

8 **B. Need for LSR 1.**

9

10 **Q: What is PSE's primary rationale for constructing the LSR 1 wind project at**
11 **this time?**

12 **A:** PSE asserts that LSR 1 was constructed, in large part, to meet Washington RPS
13 requirements in 2016 and to take advantage of federal grants and state sales tax
14 exemptions.³⁹

15 **Q: What are the Washington RPS requirements?**

16 **A:** The Energy Independence Act (EIA) provides that electric utilities in the state of
17 Washington serving more than 25,000 customers shall use eligible renewable
18 resources or acquire equivalent renewable energy credits, or a combination of

19 / /

20 / / /

21 / / / /

22 / / / / /

³⁹ Exhibit No. RG-1HCT, pp. 3 and 18 (Garratt Direct Testimony).

1 both, to meet the following annual targets:

- 2 (i) At least three percent of its load by January 1, 2012, and
3 each year thereafter through December 31, 2015;
4 (ii) At least nine percent of its load by January 1, 2016, and
5 each year thereafter through December 31, 2019; and
6 (iii) At least fifteen percent of its load by January 1, 2020,
7 and each year thereafter.⁴⁰

8 **Q: What level of new renewable resources were identified in PSE's 2009 IRP as**
9 **being necessary to meet the above RPS requirement?**

10 A: PSE's 2009 IRP identified a need for 1,000 MW of new wind generation additions
11 by 2020, including 300 MW of wind additions by 2012, plus another 300 MW of
12 new wind by 2016⁴¹.

13 **Q: Has PSE explained in detail how it determined these required levels of new**
14 **wind generation reflected in its 2009 IRP?**

15 A: No. However, as shown in Figure 3, the 2009 IRP-specified levels of new wind
16 would produce approximately 2 to 7 times the level of renewable energy needed
17 to meet the Company's RPS requirements through 2020.

Q. Was it necessary to construct LSR 1 in order to meet PSE's RPS requirements?

A: No. As shown in Figure 4, based on the load forecast PSE used for its 2009 IRP and *without* the addition of 343 MW supplied by the LSR 1 project, PSE still has approximately 4 times the amount of renewable energy required to meet its RPS target through 2015 and sufficient renewable energy to meet the Company's RPS requirement until at least 2018.

//

Figure 4 - PSE Existing Renewable Energy without LSR 1 vs. RPS Energy Requirements (GWh)

<u>Year</u>	<u>1 / RPS Load</u>	<u>RPS Target</u>	<u>RPS Target, GWh</u>	<u>2 / Existing Renewable</u>	<u>Existing % of Target</u>	<u>Surplus/ (Shortfall), GWh</u>
2011	21,391	0%	-	1,322		1,322
2012	22,018	3%	661	2,648	400.8%	1,987
2013	23,186	3%	696	2,739	393.8%	2,043
2014	23,216	3%	696	2,891	415.2%	2,195
2015	23,201	3%	696	2,956	424.7%	2,260
2016	23,229	9%	2,091	2,960	141.6%	869
2017	23,326	9%	2,099	2,347	111.8%	248
2018	23,435	9%	2,109	1,726	81.8%	-383
2019	23,521	9%	2,117	1,478	69.8%	-639
2020	23,644	15%	3,547	1,482	41.8%	-2,065

Notes: 1 / Source is PSE's response to Public Counsel Data Request No. 273.
 2 / Existing renewable reflects banked plus current year generation.

Moreover, it is likely that PSE would be able to purchase RECs to supply the relatively small renewable energy deficit that is forecasted to exist in 2018-2020. For example, based on PSE's projected REC price of approximately \$8/MWh,⁴² the Company could have purchased sufficient RECs to fully meet its RPS requirements through 2020 at a total cost of approximately \$33 million. This amount is obviously far lower than the \$158 million per year revenue requirement that PSE would otherwise incur by constructing LSR 1 as proposed in this case.

Q: How did the addition of LSR 1 impact PSE's RPS requirements?

A: As shown in Figure 5, with the addition of LSR 1, and based on the 2009 IRP load forecast, PSE was expected to have a 1.3 to 6.8 times the level of RECs needed to meet its RPS requirement, and a 34 percent excess over its 15 percent RPS requirement in 2020.

⁴² Exhibit No. SN-6.

2019	23,521	9%	2,117	343	4,757	224.7%	2,641
2020	23,644	15%	3,547	343	4,761	134.2%	1,215
			14,711				

Notes: 1 / Source is PSE's response to Public Counsel Data Request No. 273.

2 / Projected renewable reflects existing, plus proposed and banked renewable generation.

4

5 **Q: Why is the level of new renewable energy need proposed by PSE so much**
 6 **higher than that required under the Washington RPS?**

7A: PSE's forecast of its renewable energy needs failed to consider the REC banking
 8 provisions⁴³ under Washington's RPS statute and also appears to have ignored the 20
 9 percent REC credit provided to renewable projects that employ apprentice workers.⁴⁴
 10 Due to these errors, PSE significantly understated the renewable energy that could be
 11 supplied from existing resources to meet RPS requirements and, therefore, significantly
 12 overstated the new renewable energy PSE needed to meet RPS targets over the next ten
 13 years, as reflected earlier in my Figure 3.

⁴³ RCW 19.285.040(2)(e).

⁴⁴ Exhibit No. SN-7; RCW 19.285.040(2)(h)(i).

1 **Q: How do the REC banking provisions of the RPS statute work?**

2 A: The REC banking provisions allow PSE and other utilities to meet the RPS annual
3 target requirement with RECs produced during that year, the preceding year, or
4 the subsequent year. In other words, RECs generated in excess of the RPS
5 requirement in any year can be used to meet RPS requirements in the following
6 year. PSE projects it will generate a large surplus of RECs over the next several
7 years (with or without LSR 1), which, under the banking provisions, could be
8 used to meet a portion of the RPS requirements of the next year. The Company
9 failed to consider these important REC banking provisions, and, thus, overstated
10 the amount of renewable energy needed to meet its RPS requirements. This
11 appears to have contributed to PSE's decision to acquire LSR 1 years before it
12 was actually needed.

13 **Q: Did the overstated forecast of renewable energy need impact the Company's**
14 **analysis of the cost-effectiveness of adding new wind generation before it was**
15 **necessary to meet RPS targets?**

16 A: Yes.

17 Because PSE overstated its renewable energy requirements, the level of new wind
18 generation included in the "No Early Wind" scenario was also overstated, and
19 therefore the cost that PSE would have incurred if it did not construct new wind
20 generation early was also overstated. This error, as well as other errors included
21 in the Company's cost/benefit analysis, led PSE to incorrectly conclude that it
22 would be beneficial to add LSR 1 years before it was needed to meet RPS targets.
23 These errors are explained further in the next section of my testimony.

1 **C. Cost Effectiveness of Early Wind Additions.**

2 **Q: What evidence has PSE presented to support its claim that the construction**
3 **of LSR 1 before it was required to meet RPS requirements was cost-**
4 **effective?**

5 A: PSE witnesses Garratt and Seelig generally assert in their direct testimony that the
6 Company's decision to construct LSR 1 early was justified by the Company's
7 2009 IRP analysis as presented on page 10 of witness Garrett's Exhibit No. RG-
8 3.⁴⁵ In addition, PSE's discovery responses state that the Company conducted
9 four analyses to demonstrate that the acquisition of LSR 1 early produces benefits
10 that offset the cost of early acquisition:⁴⁶

- 11 1) the 2009 Integrated Resource Plan
- 12 2) Re-run of the 2009 IRP Models
- 13 3) Discounted Cash Flow (DCF) Analysis
- 14 4) Comparative Analysis of Renewable Resources as part of PSE's
- 15 2010 RFP process

16 **Q: Do you agree that the above analyses demonstrate that adding wind early**
17 **was cost effective as the Company claims?**

18 A: No, I do not. While PSE has provided a significant volume of documentation for
19 the above analyses, as described further below, the underlying analysis is
20 critically flawed and does not demonstrate that early wind additions were cost
21 effective.

⁴⁵ Exhibit No. RG-1HCT, p. 12 (Garratt Direct Testimony), and Exhibit No. AS-1HCT, p. 19 (Seelig Direct Testimony).

⁴⁶ PSE Response to Public Counsel Data Request No. 38.

1 **1. 2009 IRP Analysis and Re-run of 2009 IRP Analysis.**

2 **Q: Did PSE's 2009 IRP analyses and Re-run of the 2009 IRP analyses**
3 **demonstrate the cost-effectiveness of adding new wind generation early?**

4 A: No. While these analyses addressed the cost-effectiveness of adding wind
5 generation earlier rather than later based on *generic* wind generation costs, PSE
6 admits that "the 2009 IRP does not specifically address the Lower Snake River
7 Phase 1 Wind Project".⁴⁷

8 **Q: Why did PSE re-evaluate the cost effectiveness of early wind additions in the**
9 **Company's Re-run of the 2009 IRP analysis?**

10A: PSE indicates that its Re-run of the 2009 IRP analysis was conducted to refine the lowest
11 cost development schedule for the LSR project, and to update its 2009 IRP analysis to
12 reflect declines in wind turbine capital costs due to the global financial crisis, to reflect
13 the U.S. Treasury Grant (since the 2009 IRP analysis assumed PTCs) and to reflect the
14 extension of the Washington renewable generation sales and use tax exemption.⁴⁸ The
15 Re-run of the 2009 IRP analysis was conducted in September and October of 2009 and
16 was relied upon by PSE in reaching its decision to issue an RFP to acquire new wind
17 generation in 2012. As such, the Re-run of the 2009 IRP was one of the key analyses
18 supporting PSE's decision to add wind early.

⁴⁷ PSE Response to Public Counsel Data Request No. 38.

⁴⁸ Exhibit No. AS-1HCT, pp. 20, 24 (Seelig Direct Testimony)

1 **Q: Did PSE's Re-run of the 2009 IRP analysis demonstrate the cost-effectiveness**
2 **of early wind additions?**

3 A: No, it did not. The Re-run of the 2009 IRP analysis suffered from at least six
4 serious analytical flaws which led the Company to wrongly conclude that the
5 early addition of wind generation such as LSR 1 was cost-justified. These
6 analytical flaws include the following:

7 1) PSE, by mistake, failed to use the proper market energy price forecast
8 for all of the Business as Usual (BAU) scenarios and thereby overstated
9 the benefit of adding renewable energy before it was necessary by
10 approximately \$177 million on a present value basis;

11 2) As noted above, PSE's early wind analysis failed to consider the REC
12 banking provisions of Washington's RPS statute and thus overstated the
13 level of renewable energy needed to meet RPS requirements. ;

14 3) PSE unreasonably assumed that wind PTCs would no longer be
15 available for new projects placed in service after 2012 in all scenarios
16 evaluated, despite the fact that PTCs have been available for the last 20
17 years;

18 4) The Company used an outdated and overstated carbon price forecast
19 for the analyses, thereby overstating estimated benefits of early wind
20 additions;

21 5) PSE improperly calculated "end effects" associated with new wind
22 energy resources in all scenarios evaluated, thereby significantly
23 overstating the benefits of early wind additions; and

1 6) PSE failed to evaluate REC purchases as a potential low cost
2 alternative to constructing new wind generation in its analysis of the cost-
3 effectiveness of early wind additions.

4 I will discuss each of these analytical flaws in further detail below.

5 **a. 2009 Business As Usual (BAU) market price Error.**

6 **Q: Please explain the problem related to PSE's use of the wrong market price**
7 **forecast for analysis of wind generation under the BAU scenarios?**

8 A: PSE evaluated the cost effectiveness of adding wind generation early under two
9 primary scenarios. Under the "2009 Trends" scenario, PSE assumed higher
10 market prices which reflected economic recovery and adoption of carbon
11 regulations. Under the "2009 BAU" scenario, PSE assumed lower market prices
12 which represented the potential for slow economic recovery and only limited
13 future carbon regulations. The market prices for each of these scenarios are
14 summarized in Figure 6 below.

15 / /

16 / / /

17 / / / /

18 / / / / /

19 / / / / / /

20 / / / / / / /

1 **Figure 6 - Forecasted Market Prices for "2009 Trends" and "2009 BAU"**
2 **Scenarios, \$/MWH**
3

<u>Year</u>	<u>2009 Trends</u>	<u>2009 BAU</u>	<u>Difference</u>
2012	\$65	\$37	(\$28)
2013	\$67	\$38	(\$29)
2014	\$69	\$38	(\$31)
2015	\$72	\$39	(\$33)
2016	\$73	\$39	(\$34)
2017	\$77	\$39	(\$38)
2018	\$80	\$40	(\$40)
2019	\$83	\$41	(\$42)
2020	\$85	\$40	(\$45)
2021	\$89	\$41	(\$48)

Source of Market Prices is Garratt's Exhibit No. RG-3, pages 454 and 455.

4
5 As a result of my review of PSE's analysis, I determined that PSE had
6 used the same "2009 Trends" market price forecast (containing higher costs) in
7 evaluating wind energy additions for both the "2009 Trends" and "2009 BAU"
8 scenarios.

9 Public Counsel requested a discovery conference with the Company to
10 inquire about this problem. In a conference call with PSE witness Aliza Seelig on
11 November 18, 2011, the Company acknowledged that it had used the wrong
12 market price forecast for the "2009 BAU" scenarios. In a follow-up discovery
13 response provided on November 23, 2011, the Company formally confirmed this
14 error, and admitted that it had made the same error in its analysis of wind energy
15 proposals submitted in response to its 2010 RFP. As part of the data request

1 response, PSE provided updated models which corrected the error to reflect the
2 proper market prices for the "2009 BAU" scenario.⁴⁹

3 **Q: What was the impact of these errors?**

4 A: Generally, higher market prices favor early wind additions since the primary
5 benefit of wind energy is its ability to displace market energy purchases. If
6 market prices are lower, the replacement energy value of wind is lower, and in
7 such cases there is likely to be little or no economic advantage to adding wind
8 energy before needed to meet RPS requirements.

9 More specifically, PSE's use of "2009 Trend" market prices for the "2009
10 BAU" scenario had the effect of improperly overstating the total portfolio cost of
11 the "No Early Wind" case by more than **[Begin Confidential] XXXXXXXX [End**
12 **Confidential]** on a present value basis. The error also meant that the cost
13 advantage of early wind additions over the "No Early Wind" build case was
14 overstated by approximately **[Begin Confidential] XXXXXXXX [End**
15 **Confidential]** on a present value basis⁵⁰.

16 As shown in Figure 2, correction of this error also added to the estimated
17 average cost increases over the next four years resulting from adding wind early
18 when compared to the "No Early Wind" case. These added increases are
19 approximately **[Begin Confidential] XXXXXXXX [End Confidential]** per year in
20 the "2009 Trends" scenario and nearly **[Begin Confidential] XXXXXXXX [End**
21 **Confidential]** per year for the "2009 BAU" scenario. Obviously, this major error

⁴⁹ PSE Response to Public Counsel Data Request No. 345.

⁵⁰ Exhibit SN-8C.

1 significantly distorted the results of PSE's analysis of the cost effectiveness of
2 adding new wind before it was needed as well as its economic analysis of LSR 1
3 against wind energy proposals received in response to its 2010 RFP.

4 **b. Overstatement of renewable energy needed to meet RPS**
5 **requirements.**

6
7 **Q: Please explain how PSE's overstatement of the amount of renewable energy**
8 **needed to meet RPS requirements impacted its cost effectiveness analysis of**
9 **early wind additions?**

10 **A:** PSE claims that its decision to construct LSR 1 early was cost justified. However,
11 as shown in Figure 7 below, the cost/benefit analyses conducted by PSE to
12 support this decision included the addition of 1,000 MW of new wind generation
13 by 2020 *in all scenarios evaluated*, including the "No Early Wind" scenario.

2

3

4

5

6

7

8

9

Because PSE failed to consider the REC banking provisions of the RPS, it incorrectly concluded that it would have to add 400 MW of new wind generation by 2016 plus another 600 MW in 2020 in the "No Early Wind" case. However, as shown in Figure 4 above, when REC banking provisions are properly considered, for the "No Early Wind" case PSE actually required no new wind generation until 2018, and only 400 MW of new wind generation in 2018 to meet its RPS requirements through 2020.

10

11

12

13

14

15

16

By overstating the level of new wind generation needed to meet RPS requirements in 2020 by 600 MW, and by wrongly concluding it would need to add 400 MW of new wind in 2016, two years before it was actually needed, PSE greatly overstated the cost of RPS compliance for the "No Early Wind" scenario. As I previously noted, even with these errors the "No Early Wind" scenario had a much lower cost than every early wind scenario evaluated by PSE over the first ten years.⁵² However, by greatly overstating the wind requirement and cost of the

⁵¹Exhibit No. AS-1HCT, p. 25 (Seelig Direct Testimony, Table 5).

⁵² See Figure 1.

1 "No Early Wind" scenario, PSE greatly understated even further the significant
2 cost advantage that this scenario had over the early wind cases.

3 **Q: Are you able to estimate the impact of overstating the renewable resource**
4 **need on PSE's cost/benefit analysis of adding new wind generation early?**

5 A: Yes. As I previously noted, PSE's 2009 Re-run of the IRP analysis indicated that
6 adding new wind generation early (in 2012) increased costs for the PSE system on
7 average by approximately **[Begin Confidential] XXXXXXX [End Confidential]**
8 per year over the 2012-2015 period in the "2009 Trends" scenario, and by
9 approximately **[Begin Confidential] XXXXXXX [End Confidential]** per year in
10 the "2009 BAU" scenario when compared to the "No Early Wind" case.⁵³ Based
11 on the midpoint of this range (i.e., **[Begin Confidential] XXXXXX [End**
12 **Confidential]** per year), the cost advantage of the "No Early Wind" scenario over
13 the early wind cases evaluated by PSE would be increased by approximately
14 **[Begin Confidential] XXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX [End**
15 **Confidential]** if the Company had properly recognized that new wind generation
16 was not needed until 2018 in its "No Early Wind" scenario. Correcting for this
17 error alone would eliminate any cost advantage of early wind scenarios forecasted
18 by PSE.

19 //

21 ////

22

⁵³ Exhibit SN-8C.

1 **c. Assumed termination of PTCs after 2012.**

2 **Q: What is the problem with PSE's assumption that wind PTCs would not be**
3 **available on projects which entered service after 2013?**

4 A: PSE's assumption that PTCs would not be available for any new wind generation
5 projects placed in service after 2013 was one of the primary factors contributing
6 to the estimated economic benefit of adding new wind early. Because PSE
7 assumed in all scenarios that wind projects placed in service after 2013 would not
8 be eligible for PTCs, this had the effect of creating a significant capital cost
9 advantage for early wind generation projects, such as LSR 1, when compared to
10 wind projects that were projected to enter service after 2013. For example, the
11 estimated advantage of this PTC expiration assumption for a project such as LSR
12 1 was approximately \$228 million on a present value basis.⁵⁴

13 Obviously, without this very substantial assumed PTC expiration benefit,
14 PSE's estimated economic benefit of adding new wind generation such as LSR 1
15 early would be entirely eliminated. For example, PSE's Re-run of the 2009 IRP
16 analysis estimated that the net present value of the "2009 IRP Resource Plan"
17 case, which most closely compares to the LSR 1 proposal in timing of early wind
18 additions, was only \$32 million lower than the "No Early Wind" case under the
19 "2009 Trends" scenario, and \$35 million higher than the "No Early Wind" case
20 under the "2009 BAU" scenario. These estimates include the \$228 million PTC
21 expiration benefit for the "2009 IRP Resource Plan" case and were evaluated over
22 a 50-year period.

⁵⁴ PSE Response to Public Counsel Data Request No. 52.

1 However, if the assumed \$228 million PTC expiration benefit was
2 excluded, or even reduced by 50 percent to conservatively account for the
3 possibility that wind PTCs could be extended, with no other adjustments, the
4 modest cost advantage of the early wind scenarios forecasted by PSE would be
5 entirely eliminated.

6 **Q: What was the basis for PSE's assumption in all scenarios that wind PTCs**
7 **would not be available for wind projects placed in service after 2013?**

8 A: This assumption appears to have been based on the fact that at the time the 2009
9 IRP was being completed, existing laws provided for wind PTCs to be effective
10 for projects placed in service no later than December 31, 2012⁵⁵. However, wind
11 PTCs have been in effect almost continuously for the last 20 years, and in past
12 IRPs PSE has assumed that wind PTCs would continue over the planning horizon
13 even when there was not legislation supporting this.⁵⁶ For example, in PSE's
14 2005 IRP the Company assumed that PTCs for wind would be available over the
15 entire planning period, but would decline in value over time.

16 **Q: Is PSE's assumption that wind PTCs would not be available for wind**
17 **projects placed in service after 2013 consistent with the Company's**
18 **assumptions regarding carbon taxes?**

19 A: No. For its analysis of the cost-effectiveness of adding wind earlier than needed,
20 PSE assumed that carbon taxes would be in effect in 2012 and remain in effect
21 over the entire 50-year period considered by its Re-run of the 2009 IRP analysis,

⁵⁵ PSE Response to Public Counsel Data Request No. 270.

⁵⁶ PSE Response to Public Counsel Data Request No. 271.

1 even though there were no laws providing for carbon taxes at the time these
2 analyses were conducted (and still are no such laws). It was inconsistent and
3 unreasonable for PSE to assume existing laws providing for PTCs would expire
4 after 2013 in all scenarios, while at the same time assuming carbon taxes would
5 be in effect in all scenarios.

6 At minimum, in evaluating the cost-effectiveness of early wind additions,
7 PSE should have conservatively accounted for the potential that wind PTCs could
8 be extended beyond 2013, as it has in past IRP analyses. This would have
9 provided a more reasonable and conservative analysis to evaluate the potential
10 cost effectiveness of adding new wind generation before it was needed to meet
11 RPS requirements.

12 The Company's failure to consider the potential for PTCs to be available
13 for projects placed in service after 2013 was imprudent, particularly in light of the
14 difficult economic climate that existed at the time, and the significant impact that
15 this assumption had on the results of the early wind analysis. By ignoring the
16 possibility of PTC extension in its early wind analysis, PSE's analysis represents
17 an extreme and overstated estimate of the benefits of early wind to its customers.

18 **d. Use of outdated carbon price forecast.**

19 **Q: What are your concerns regarding PSE's 2009 Trends carbon price forecast?**

20 A: As shown in Figure 8, the forecasted carbon prices used for PSE's 2009 Trends
21 scenario were two to three times higher than any other carbon forecast the
22 Company has used for resource planning analyses in recent years.
23

1

2

Note: Sources are PSE's response to Public Counsel Data Request Nos. 45 and 280.

3

The extraordinarily high level of the 2009 Trends carbon price forecast had the

4

effect of increasing market prices used for this scenario by approximately 50

5

percent (\$20/MWh).⁵⁷ This, of course, increased the estimated benefits of adding

6

wind energy earlier than needed to meet RPS requirements since wind energy

7

primarily displaces market energy purchases.

⁵⁷ PSE Response to Public Counsel Data Request No. 315.

1 **Q: Why was PSE's 2009 Trends carbon price forecast so much higher than the**
2 **carbon forecast used by PSE to evaluate wind energy proposals received in**
3 **response to its 2010 RFP?**

4 A: PSE's 2009 Trends carbon price forecast was based on a March 2008 EPA
5 analysis of proposed carbon legislation.⁵⁸ The much lower carbon price forecast
6 used by PSE to evaluate wind energy proposals received in response to its 2010
7 RFP was based on a newer EPA analysis of carbon legislation published in
8 October of 2009.⁵⁹ PSE indicates that it used this updated carbon price forecast
9 "because it was lower than the 2009 Integrated Resource Plan's (IRP) base carbon
10 price forecast and more reflective of the then-current political climate for carbon
11 regulation."⁶⁰ Notwithstanding the availability of the new October 2009 EPA
12 analysis, PSE continued to use the older forecast with its higher carbon costs for
13 its Re-run of the 2009 IRP analysis of the cost effectiveness of early wind
14 additions.

15 **Q: Was it prudent for PSE to use the outdated carbon price forecast from**
16 **March of 2008 to evaluate the cost effectiveness of adding new wind**
17 **generation early in the "2009 Trends" scenario?**

18 A: No. PSE's use of the outdated carbon forecast for the "2009 Trends" scenario
19 resulted in the unreasonable and significant overstatement of benefits of early
20 wind additions. As it did for the 2010 RFP process, the Company should have

⁵⁸ Exhibit SN-9.

⁵⁹ Exhibit SN-9.

⁶⁰ PSE Response to Public Counsel Data Request No. 192.

1 used the more recent carbon price forecast based on EPA's October 2009
2 analysis, as the basis for evaluating the cost effectiveness of early wind additions.

3 **Q: Have you estimated the impact of PSE's use of the outdated carbon price**
4 **forecast upon the results of the Company's analysis?**

5 A: Yes. I estimate that if PSE had used EPA's October 2009 carbon price forecast
6 for the "2009 Trends" scenario, this would have increased costs of early wind
7 scenarios by approximately \$99 million on a present value basis when compared
8 to the level forecasted by PSE.⁶¹ When coupled with other adjustments I have
9 discussed, this carbon price update would further increase the economic
10 advantage of the "No Early Wind" scenario over early wind cases evaluated by
11 PSE.

12 **e. Improper calculation of end effects.**

13 **Q: What are "end effects"?**

14 A: End effects represent the estimated remaining value of generating resources
15 beyond the period evaluated in resource planning studies. End effects are often
16 considered when comparing resource plans that include plant additions that occur
17 at different times during the planning period.

18 **Q: What are your concerns regarding PSE's calculations of end effects for its**
19 **analysis of the cost effectiveness of early wind additions?**

20 A: There were two basic problems with PSE's end effects calculations. First, the
21 Company improperly assumed that wind resources which retired after the 20-year
22 evaluation period would not be replaced. This error ignores the fact that PSE

⁶¹ Exhibit SN-10.

1 would need to maintain approximately 1100 MW of wind generation to meet its
2 RPS requirements after 2029 in all scenarios. By failing to replace units that
3 retire during the end effects evaluation period, PSE's end effects calculation has
4 improperly created a mismatch in the level of wind resources during the end-
5 effects period. This mismatch results in a higher end effects cost for the "No
6 Early Wind" scenarios which add wind resources later, while at the same time
7 understating end effects costs for the early wind addition scenarios whose units
8 are retired earlier during the end effects period.

9 My second major concern with PSE's inclusion of end effects estimates is
10 that the Company's end effects calculations are inherently uncertain due to the
11 fact that they involve forecasts of market prices, generating unit performance and
12 generation for a period that is 20 to 50 years into the future. For this reason, and
13 due to the flaw in PSE's end effects calculation, the Company's end effects
14 estimates should not be relied upon as a primary component of a cost/benefit
15 analysis for early wind additions.

16 **Q. How do PSE's flawed end effects calculations impact the results of the**
17 **Company's cost effectiveness analysis of early wind additions?**

18 A. PSE's end effects estimates serve to overstate the benefit of early wind scenarios
19 by approximately **[Begin Confidential] XXXXXX [End Confidential]** on a
20 present value basis.⁶² Removing this flawed and uncertain cost component from
21 PSE's early wind analysis further increases the economic advantage of the "No
22 Early Wind" case over early wind scenarios.

⁶² Exhibit SN-11C.

1 **f. Failure to evaluate REC purchase alternatives.**

2 **Q: What is your concern regarding PSE's failure to consider REC purchases as**
3 **an alternative in evaluating the cost- effectiveness of adding wind early?**

4 A: PSE's economic analysis did not evaluate REC purchases as an alternative to the
5 acquisition of new wind generation facilities as a means to supply a portion of the
6 Company's RPS requirements. For example, as noted earlier in my testimony,
7 PSE could have met its RPS requirements through 2020 without LSR 1, for a total
8 cost of approximately \$33 million, based on the Company's REC price forecast.
9 This could have been achieved by purchasing RECs to meet forecasted RPS
10 shortfalls in 2018, 2019 and 2020. The failure to consider the option of
11 purchasing RECs, which the Company forecasts would cost approximately
12 \$8/MWh, greatly overstated the cost of RPS compliance in the "No Early Wind"
13 scenario. This, in turn, overstated the estimated benefits of acquiring new wind
14 energy projects, such as LSR 1, early by approximately **[Begin Confidential]**
15 **XXXXXXXX [End Confidential].**⁶³

16 **2. DCF Analyses.**

17 **Q: Did PSE's DCF analyses address the cost-effectiveness of adding new wind**
18 **generation before it was needed to meet RPS requirements?**

19 A: No. As shown in Figure 9 below, PSE's DCF analyses only evaluated wind build
20 scenarios which added significant amounts of new wind capacity early; i.e.,
21 before the 2016-2018 timeframe that new capacity was required to meet the RPS
22 target. The DCF analyses did not evaluate any "No Early Wind" scenarios.

⁶³ Exhibit SN-12C.

2

3

Moreover, PSE's DCF analyses considered only the differences in *capital costs*

4

between these early wind resource plans. In essence, the purpose of the DCF

5

analyses was simply to identify how much new wind generation could be added

6

before December 31, 2012.⁶⁵ These analyses did not address whether the total

7

capital and operating costs of adding wind generation projects such as LSR 1

8

early were economically justified when compared to the alternative of not adding

9

new wind generation until needed.

10

//

/////

⁶⁴ Exhibit No. AS-1HCT, p. 22 (Seelig Direct Testimony, Table 3).

⁶⁵ Exhibit No. AS-1HCT, pp. 21-22 (Seelig Direct Testimony). December 31, 2012 was the date PSE assumed that federal tax incentives for new wind projects would expire in all scenarios.

1 **3. Analysis of Wind Proposals from PSE's 2010 RFP.**

2 **Q: Did PSE's analyses of wind energy proposals received in response to the**
3 **Company's 2010 RFP address the cost-effectiveness of adding new wind**
4 **generation early?**

5 A: No. The comparative analyses of wind energy proposals received in response to
6 PSE's 2010 RFP did not address whether adding new wind generation early was
7 cost justified. These analyses simply compared the costs of LSR 1 and other wind
8 energy proposals, all of which were anticipated to begin service in 2012. The
9 analyses did not examine whether such proposals were cost-justified when
10 compared to an alternative of not adding new wind generation until needed to
11 meet PSE's RPS requirements.

12 **4. Summary of Findings on Cost Effectiveness of Early Wind**

13 **Q: Please summarize your findings regarding PSE's analysis of the cost**
14 **effectiveness of adding new wind generation such as LSR 1 before needed to**
15 **meet RPS requirements?**

16 A: PSE's analysis of the cost effectiveness of adding wind early was flawed by a
17 number of major errors and unreasonable assumptions. As shown in Figure 1 of
18 my testimony, the Company's flawed cost effectiveness analysis estimated no
19 benefits from early wind additions over the next 10 years under all scenarios, and
20 no benefits over the next 20 years in half of the scenarios evaluated. Even
21 without correcting for the analytical flaws that I have discussed (i.e., PTC
22 termination, excessive carbon costs, excessive wind additions, etc.) which
23 improperly biased the economic analysis in favor of early wind additions, the

1 Company's own analysis indicates that *there are no forecasted benefits* of adding
2 new wind generation early in any scenario over the next 10 years.⁶⁶ In fact, PSE's
3 analysis forecasts an average net increase in costs for early wind scenarios over
4 the 20-year planning horizon under its 2009 IRP early build plan when compared
5 to delaying new wind additions until 2016. With reasonable adjustments to
6 address the flaws in PSE's analysis that I have discussed, the cost advantage of
7 postponing wind additions until needed over the early wind scenarios is
8 overwhelming.

9 **Q: Have there been any changes in market conditions since PSE completed its**
10 **last analysis of the cost effectiveness of early wind additions in October of**
11 **2009 that are likely to increase the benefits associated with early wind**
12 **additions such as LSR 1?**

13 A: No. In fact, the major changes which have occurred since PSE completed its
14 analysis of the benefits of early wind additions would reduce the level of early
15 wind benefits estimated by the Company. For example, the revenue requirement
16 of LSR 1 requested in this case is \$22.8 million per year higher than the level
17 assumed in PSE's economic analyses of the project in comparison to competing
18 bids in its 2010 RFP.⁶⁷ Carbon taxes, which were a major assumed benefit of new
19 wind energy in PSE's earlier analyses, have not been implemented. Market prices
20 are also currently much lower than assumed by PSE in its analysis of early wind
21 additions, which further decreases the forecasted benefits of early wind additions
22

⁶⁶ Exhibit No. SN-5.

⁶⁷ PSE Response to Public Counsel Data Request No. 279.

1 from the level estimated by PSE in justifying its decision to construct LSR 1

2 In addition, due to the continuing slow pace of the economic recovery, the
 3 Company's load forecast is now approximately 6 percent lower than the forecast
 4 used to evaluate the cost effectiveness of early wind additions in the "2009
 5 Trends" scenario. As shown in Figure 10 based on PSE's 2011 load forecast, with
 6 the addition of LSR 1 and no other new wind additions, PSE's available
 7 renewable energy would be 1.4 to 7.3 times the level needed to meet RPS
 8 requirements through 2020.

9 **Figure 10 - PSE Existing Renewable Energy Plus LSR 1 vs. 2011 Forecast of RPS**

Notes: 1 / Source is PSE's response to Public Counsel Data Request No. 273.

2 / LSR 1 Renewable MW reflects proposed LSR 1 capacity only.

3 / Projected renewable reflects existing, plus proposed and banked renewable generation.

12 For the above reasons, the cost increase resulting from PSE's decision to construct
 13 LSR 1 early will be far greater than estimated by the Company in its 2009 early
 14 wind cost effectiveness studies. Given the economic uncertainty and uncertainty
 15 involving carbon regulations that existed when PSE completed its early wind
 16 studies in late 2009, it is not surprising that the benefits of early wind additions
 17 have proven to be much lower than predicted by the Company at that time.
 18

1 **Q: What do the results of PSE's cost effectiveness analysis for LSR 1 and the**
2 **revised forecast of PSE's RPS requirements in Figure 10 indicate regarding**
3 **the Company's previously expressed plan to develop other phases of the LSR**
4 **wind project over the next few years?**

5 **A:** As shown in Figure 10, under PSE's current load forecast, the addition of LSR 1
6 will produce more renewable energy than is needed to meet the Company's RPS
7 requirement through 2020. Including the Treasury Grant benefit, the cost of
8 energy from the LSR 1 project is approximately \$138/MWh, which is
9 approximately **[Begin Confidential] XX[End Confidential]** times PSE's
10 forecasted rate year price of market energy purchases. PSE has no need for
11 additional wind energy from development of additional phases of the LSR project
12 (or from other wind resources) for the foreseeable future. Given these facts, any
13 plan by the Company to expand its investment in LSR wind energy resources
14 would be imprudent at this time.

15 **VI. USED AND USEFUL DETERMINATION**

16 **Q: What are the key issues underlying the Commission's used and useful**
17 **standard as applied to new wind resources, such as LSR 1, that are added**
18 **before needed to meet RPS requirements?**

19 **A:** The Commission's used and useful standard for early wind resources such as

1 LSR 1 is described in the Commission's *Renewable Resource Policy*

2 *Report* as follows:

3 Early acquisition of a renewable resource is “useful” in that
4 it will meet the RPS at some point in the future. It also
5 needs to be “used.” Therefore, the utility must show that
6 the resource produces benefits that offset the cost of early
7 acquisition. This could include sale of energy generated
8 from the plant, sale of RECs from the plant, or other value
9 to the company attributable to the acquisition.⁶⁸

10

11 **Q: Do PSE's economic analyses of LSR 1 demonstrate that the benefits of the**
12 **project offset the cost of early acquisition and therefore meet the "used"**
13 **standard?**

14 A: No. As discussed earlier in my testimony, PSE's economic analysis of the early
15 wind addition option show that the costs of adding wind early do not offset the forecasted
16 benefits, even with the Company's extreme assumptions which unduly bias the results in
17 favor of the early wind addition option. Moreover, as shown in Figure 5 of my
18 testimony, the addition of the LSR 1 project will cause the Company to significantly
19 exceed its RPS target through 2020. For wind projects that exceed the RPS, the
20 Commission indicates that it would apply the same "used and useful" standard which it
21 applies to any other new resource addition, which requires that an asset provide benefits
22 to ratepayers in Washington that are reasonably quantifiable and commensurate with their
23 costs.⁶⁹

⁶⁸ *Renewable Resource Policy Report*, ¶ 56.

⁶⁹ *Renewable Resource Policy Report*, ¶ 63, ¶ 31.

1 **Q: Has PSE demonstrated that LSR 1 will provide benefits to ratepayers that**
2 **are commensurate with the cost of the project?**

3 A: No. LSR 1 is not needed to meet RPS requirements at this time. The cost of the
4 project after the Treasure Grant credit on a \$/MWh basis is approximately **[Begin**
5 **Confidential]** ~~XX~~ **[End Confidential]** times the forecasted rate year price of
6 market purchases and 2 to 3 times the forecasted price of market purchases at the
7 time the Company decided to construct the project.

8 **Q: Does LSR 1 meet the Commission's used and useful standard?**

9 A: No. The LSR 1 project is not needed to meet RPS requirements until 2018 at the
10 earliest, and as indicated by the results in my Figure 1, is not expected to benefit
11 customers when compared to the "No Early Wind" alternative for the next twenty
12 years.

13 **VII. RECOMMENDED RECOVERY OF LSR 1 COSTS**

14 **Q: What are your recommendations regarding the recovery of costs for the**
15 **LSR 1 project in this case?**

16 A: PSE has requested that it be allowed to recover approximately \$158 million for its
17 investment in LSR 1 in this case.⁷⁰ For the reasons explained earlier in my
18 testimony, I believe that PSE's \$848 million investment in LSR 1 was imprudent
19 and unnecessary and that the plant will not be used and useful when placed in
20 service early next year. The early addition of the unit was not cost justified.

⁷⁰ This amount excludes approximately \$33.6 million in estimated power cost savings and the Treasury Grant credit which will be reflected in a separate tariff.

1 In light of these facts, I recommend that the LSR 1 revenue requirement
2 requested by PSE be reduced by \$55 million. This disallowance represents
3 **[Begin Confidential]** XX
4 XX
5 XXXXXXXXXXXXXXXXXXXXXXXXXXXX **[End Confidential]** The "2009 IRP
6 Resource Plan" early wind scenario most closely reflects the early wind addition
7 associated with the proposed LSR 1 project. Although the actual cost impact on
8 customers of PSE's LSR 1 investment is much larger than my recommended
9 disallowance, my disallowance conservatively reflects the estimated additional
10 cost expected to be incurred due to early wind additions based on the Company's
11 estimates at the time the decision was made to select LSR 1.

12 My recommendation allows PSE to recover requested operations and
13 maintenance costs, depreciation, property taxes, insurance, and related wheeling
14 and wind integration costs, and debt financing costs for the project, plus a modest
15 return on equity. In addition, under the existing PCA deadband mechanism, PSE
16 will be able to recover additional project costs for the LSR 1 project to the extent
17 the plant operates at a higher capacity factor, or if displacement power cost
18 savings from the plant otherwise prove to be higher than forecasted by the
19 Company in this case. recommendation

20 My recommendation is designed to mitigate the harm to ratepayers of
21 PSE's imprudent decision to construct LSR 1 early, by providing a a reasonable
22 sharing of the additional near-term costs incurred as a result of the Company's
23

1 imprudent decision to proceed with this discretionary and costly project.

2 **Q: Does that conclude your pre-filed direct testimony?**

3 A: Yes.
