ICNU Data Request 9.2

ICNU Data Request 9.2

When a sale of a REC is made from a plant eligible for Washington RPS compliance, please explain how the Company allocate that REC to Washington as opposed to other states. For example, if Goodnoe produced a REC that was sold to another company, how would the Company allocate that sale between Washington and the other states. Please differentiate between how the Company would have done it before and after the RPS went into effect, and after.

Response to ICNU Data Request 9.2

For RECs generated by west-side resources, the Company uses the Control Area Generation West (CAGW) factor to determine Washington's allocated share of the REC revenues. Beginning in 2011, Washington's share of eligible RECs generated by west side resources will not be sold, but instead retained for the purpose of meeting the requirements of Washington's Renewable Portfolio Standards.
