V.	CONCLUSION.....	29

1 **PUGET SOUND ENERGY, INC.**

2 **PREFILED REBUTTAL TESTIMONY (CONFIDENTIAL) OF**  
3 **LOUIS E. ODOM**

4 **I. INTRODUCTION**

5 **Q. Are you the same Louis E. Odom who provided in this proceeding prefiled**  
6 **direct testimony, Exhibit No. LEO-1CT, on May 8, 2009, and prefiled**  
7 **supplemental direct testimony, Exhibit No. LEO-10CT, on September 28,**  
8 **2009, each on behalf of Puget Sound Energy, Inc. (“PSE”)?**

9 A. Yes.

10 **Q. What is the purpose of your prefiled rebuttal testimony?**

11 A. My testimony responds to the recommendations by WUTC Staff (“Staff”) and  
12 Public Counsel with respect to proposed changes in operations and maintenance  
13 (“O&M”) costs included in the rate year for simple cycle combustion turbine  
14 (“SCCT”), combined cycle combustion turbine (“CCCT”) and wind generation.

15 **II. PRODUCTION OPERATION AND MAINTENANCE COSTS**

16 **Q. Have you reviewed the Staff and Public Counsel proposals regarding O&M**  
17 **costs for SCCTs, CCCTs and wind generation?**

18 A. Yes, I have reviewed the testimony and the proposals included in the testimony.  
19 Staff proposes that the Company apply an accounting methodology it calls the

1 “deferral method” for major maintenance events. Under this method, the actual  
2 cost of each planned major maintenance activity is capitalized and amortized to  
3 expense over an estimated period until the date of the next planned major  
4 maintenance event. Additionally, Staff proposes the use of a historical five-year  
5 average of maintenance expense for power costs O&M for each facility rather  
6 than the use of an average calculated from the five-year forecast for maintenance  
7 at each of the company's combustion turbine facilities, as proposed in my prefiled  
8 direct testimony.

9 **Q. Does PSE agree with Staff's proposal?**

10 A. While I still believe PSE’s original proposal is an appropriate methodology,  
11 Staff’s proposal also appears to be acceptable, with the exception of Staff witness  
12 Kathryn Breda’s method of calculating the normal maintenance expense, and on  
13 the condition that Ms. Breda’s recommended amortization period for major  
14 maintenance be modified so that the correct time period between planned  
15 maintenance events is used for amortization. Therefore, the Company is  
16 agreeable to implement the accounting guidelines for maintenance in the manner  
17 similar to that recommended by Staff and Public Counsel. The Company further  
18 agrees to start amortizing the deferred amounts when the major maintenance is  
19 completed. Later in my testimony, I will present appropriate methodologies for  
20 calculating regular maintenance expense for both gas and wind turbines on a  
21 historical basis.

1 **A. Major Maintenance**

2 **Q. Please explain how Staff's proposal differs from PSE's proposal for major**  
3 **maintenance.**

4 A. As explained above, Staff proposes that the Company apply an accounting  
5 methodology it calls the "deferral method". Under this method, the actual cost of  
6 each planned major maintenance activity is capitalized and amortized to expense  
7 over an estimated period until the next planned major maintenance event. This  
8 methodology is similar to the accounting for planned major maintenance activities  
9 provided in the AICPA Guide for Airlines.

10 The Company's original proposed rate recovery for major maintenance was to  
11 adopt the "deferral method" for accounting used for overhauls within the airline  
12 industry. The methodology included deferring major maintenance costs that  
13 exceeded \$2.0 million per occurrence and amortizing them over a five-year  
14 period. All costs under \$2.0 million would be considered minor maintenance  
15 expense and would be calculated using an average of a five-year forecast.

16 **Q. Why did the Company propose this accounting methodology?**

17 A. The Company proposed the adoption of this methodology to conform to the  
18 recently implemented airline industry accounting guidelines and to establish  
19 defined threshold limits and fixed amortization periods to allow for ease of  
20 accounting and tracking. This proposal was reasonable and consistent with the

1 accounting treatment under the accounting guidelines and the Accounting  
2 Standards Codification (“ASC”) 980, previously SFAS 71.

3 **Q. How does the Company propose rate recovery for major maintenance?**

4 A. Consistent with Staff’s and Public Council’s recommendation, the Company is  
5 proposing implementation of the deferral method of accounting for planned major  
6 maintenance as set forth within the AICPA Guide for Airlines without the \$2  
7 million limit. The actual costs of each planned major maintenance activity will be  
8 capitalized and amortized to expense over the estimated period until the next  
9 planned major maintenance activity.

10 **Q. How long are the periods between major maintenance activities for CCCTs  
11 and SCCTs?**

12 A. GE has manufactured the majority of the Company’s gas turbine generators  
13 (“GTG”), and GE’s technical publication “Heavy-Duty Gas Turbine Operating  
14 and Maintenance Considerations” addresses the recommended maintenance  
15 period for PSE’s GTGs. A CCCT’s combustion components must be replaced  
16 and inspected on a regular basis, and GE has determined that the period between  
17 these major maintenance activities is normally between two to three years,  
18 depending on the number of starts and the amount of time the CCCT operates  
19 during the period.

1 A SCCT's combustion components must be replaced and inspected on a regular  
2 basis as well. However, due to a lower capacity factor, there is generally a longer  
3 period between the next similar scheduled maintenance activity. Please see the  
4 Third Exhibit to my Prefiled Direct Testimony, Exhibit No. LEO-4, for more  
5 information regarding maintenance schedules.

6 **Q. Do the service agreements between the Company and GE require defined**  
7 **periods between major maintenance activities?**

8 A. Yes. For example, pursuant to the service agreement at Mint Farm Generating  
9 Station ("Mint Farm"), the period between GTG combustion inspections is  
10 approximately every 8,000 to 12,000 factored fired hours. The period between  
11 GTG hot gas path inspections is approximately every 24,000 factored fired hours.  
12 The period between every GTG major inspection is approximately every 48,000  
13 thousand factored fired hours. The service agreements for Goldendale, Sumas  
14 and Freddy 1 have similar contract provisions. Please see the following exhibits  
15 to my Prefiled Direct Testimony for specific service agreements: Exhibit No.  
16 LEO-6C, Exhibit No. LEO-7C, and Exhibit No. LEO-8C.

17 **Q. Are there additional balance of plant ("BOP") equipment that will be**  
18 **affected by the proposed major maintenance accounting treatment at GTG**  
19 **facilities?**

1 A. Yes. Major components such as heat recovery steam generators, selective  
2 catalytic reduction systems to meet exhaust emission limits, steam turbine  
3 generators, water treatment systems, large electrical apparatus and cooling towers  
4 will be affected by the proposed accounting treatment.

5 **Q. What are the BOP equipment manufacturer's recommendations with respect**  
6 **to the maintenance period between activities?**

7 A. Heat recovery steam generators, which include its selective catalytic reduction  
8 system, require an inspection and some amount of repair work every year. The  
9 steam turbine generator and other BOP equipment will have minor inspections  
10 every year, and major overhauls are called for on a five to ten-year cycle,  
11 depending on the equipment's operating profile, condition, and environment.

12 **B. Other Maintenance Expense**

13 **Q. How does Staff determine production maintenance expenses for its proposed**  
14 **production O&M expense adjustments?**

15 A. In general, Staff uses a historical five-year average of maintenance expense for  
16 gas generation plants rather than using the most current test year maintenance  
17 expense, which is a more accurate historical basis for maintenance expense.

18 **Q. Is the Company agreeable to Staff's proposal to use historical maintenance**  
19 **expense to determine maintenance expense?**

1 A. While I still believe that the Company's original proposal to use a five-year  
2 forecast of average maintenance costs for each facility is reasonable, the  
3 Company is willing to agree to use *recent* historical maintenance expense to  
4 determine maintenance expense. Additionally, as discussed in more detail below,  
5 for plants that PSE has recently acquired, it is appropriate to use historical  
6 maintenance expense from a similar plant.

7 **Q. How does the Company propose to determine the maintenance expense of**  
8 **Goldendale Generating Station (“Goldendale”)?**

9 A. The Company would use the test year maintenance costs.

10 **Q. Please explain why the most current test year expenses are a more accurate**  
11 **basis for determining proforma maintenance expenses for Goldendale than**  
12 **Staff’s methodology.**

13 A. Staff proposes to use an annualized thirty-month average (February 2007 through  
14 August 2009) of actual maintenance expense as a substitute for Goldendale’s test  
15 year maintenance expense. Staff’s proposed thirty-month average includes 2007  
16 maintenance expense that was not representative of normal operations at  
17 Goldendale. In 2007, the facility was transitioning from operations under the  
18 previous owners and in July 2007 the facility experienced a major compressor  
19 failure that resulted in extensive capital repairs and the plant being out of service  
20 for ten weeks.

1 PSE proposes to use 2008 actual maintenance expense in the calculation of test  
2 year operations and maintenance cost, adjusted for major maintenance. PSE's  
3 methodology is superior to Staff's because, among other reasons, use of test year  
4 actual expense in those cases where test year information is available and  
5 representative of normal operations more accurately reflects the operating  
6 conditions for the turbines in relationship to the Company's portfolio of  
7 resources.

8 **Q. Does PSE propose to use test year data for Mint Farm?**

9 A. No, Mint Farm was not in-service during the test year, therefore, PSE proposed to  
10 use a similar turbine, which in this case is Goldendale.

11 **Q. Please explain why Goldendale is a more accurate basis for determining**  
12 **proforma maintenance expenses for Mint Farm than Staff's methodology.**

13 A. Staff proposed to use Mint Farm's annualized actual operations and maintenance  
14 expense over the eight-month period January 2009 through August 2009 and  
15 seven-month period February 2009 through August 2009 in lieu of test year data.

16 This method is inappropriate for several reasons. The January through August  
17 2009 period excludes fall and early winter operations, and therefore is not  
18 representative of the operating profile experienced in a full twelve-month cycle.

19 The period also does not reflect normal operations at Mint Farm. Mint Farm was  
20 acquired in late December 2008, and prior to May 2009, the facility was operated

1 by General Electric International (“GE”) using GE personnel under an Operations  
2 agreement negotiated by the previous owner. Throughout 2009, the plant was in  
3 the process of hiring personnel and was not fully staffed.

4 In order to provide representative Mint Farm data, the Company proposes to use  
5 test year data of a like facility (Goldendale), adjusted for known and measurable  
6 differences between the operations of the two facilities and adjusted for major  
7 maintenance as noted above. PSE’s methodology takes into account  
8 representative maintenance expenses rather than simply disregarding large  
9 portions of data.

10 **Q. What time period would PSE use for determining maintenance on Sumas?**

11 A. The Company proposes to use twelve months ended October 2009.

12 **Q. Please explain why using a twelve month period ending October 2009 is a**  
13 **more accurate basis for determining proforma maintenance expenses for**  
14 **Sumas Generating Station (“Sumas”) than Staff’s methodology.**

15 A. PSE acquired Sumas in July 2008, and Staff proposed to use an annualized actual  
16 operations and maintenance costs for the thirteen-month period of August 2008  
17 through August 2009 to establish Sumas operations and maintenance expense.  
18 PSE believes this methodology to be inappropriate because the first full month of  
19 operations under PSE ownership was August 2008. August 2008 operations are  
20 not representative of normal operations because PSE was transitioning Sumas

1 from its previous owners, and it was not yet fully staffed. The thirteen-month  
2 period used by Staff does not include a full thirteen months of representative  
3 expenses such as long-term contract costs.

4 The Company proposes to use actual operations and maintenance expenses for the  
5 twelve-month period ending October 2009 as a proxy for test year data, adjusted  
6 for major maintenance as noted above. This method more accurately reflects  
7 normal operations for Sumas.

8 **Q. Do you believe the methodology used by the Staff for calculation of the**  
9 **representative year for the simple cycle plants Whitehorn, Fredonia, and**  
10 **Frederickson and the combined cycle plant Encogen is appropriate?**

11 A. No. Use of test year operations and maintenance expense provides actual cost  
12 information that is more reflective of current operations and costs than a historical  
13 five-year average. Costs for labor, chemicals and material have increased steadily  
14 over the five-year period proposed by Staff. Use of a five-year average would  
15 deflate costs compared to the test year actual expense. Furthermore, operations  
16 and maintenance practices change and evolve over time, as does the maintenance  
17 requirements of aging generating and balance of plant equipment. Use of a five-  
18 year average “turns back the clock” and tends to disassociate cost recovery from  
19 current operations and maintenance practice. The Commission should reject  
20 Staff’s proposed methodology.

1 **Q. If the Commission determines that production maintenance should be based**  
2 **on historical maintenance expenses, what corrections need to be made to**  
3 **Staff's calculation of maintenance costs?**

4 A. The following corrections to Staff's proposed maintenance expense, as presented  
5 on Ms. Breda's work paper work paper WP-KHB Adj 10.03 Power Costs (C) on  
6 tab "Maintenance on Thermals" and further adjusted for major maintenance as  
7 presented on the attached exhibit LEO-14C, would be necessary:

- 8 • Encogen: Replace \$1,630,335 five-year average maintenance expense  
9 proposed by Staff with \$1,184,664 actual 2008 maintenance expense; back  
10 out \$48,984 of major maintenance expense incurred in 2008.
- 11 • Frederickson: Replace \$538,169 five-year average maintenance expense  
12 proposed by Staff with \$796,261 actual 2008 maintenance expense.
- 13 • Fredonia Units 1-4: Replace \$1,239,681 five-year average maintenance  
14 expense proposed by Staff with \$668,192 actual 2008 maintenance expense.
- 15 • Whitehorn: Replace \$1,602,715 five-year average maintenance expense  
16 proposed by Staff with \$4,839,332 actual 2008 maintenance expense; back  
17 out \$4,585,047 of major maintenance expense incurred in 2008.
- 18 • Freddy 1: Replace \$1,853,195 five-year average maintenance expense  
19 proposed by Staff with \$1,983,996 actual 2008 maintenance expense; add  
20 adjustment in the amount of \$256,294 to adjust Epcor 2010 and 2011 budgets  
21 to rate year.
- 22 • Goldendale: Replace \$2,495,746 annualized maintenance expense proposed  
23 by Staff with \$2,581,018 actual 2008 maintenance expense; back out  
24 \$856,660 of major maintenance expense incurred in 2008; add \$354,580  
25 annual amortization expense associated with Combustion Inspection  
26 performed in May 2009..
- 27 • Mint Farm: Because there is insufficient historical cost data to provide a  
28 representative substitute period for the test year, PSE proposes using a similar  
29 facility's (Goldendale) test year actual O&M expense, adjusted for known and  
30 measurable differences, as a proxy for Mint Farm. Replace \$4,997,350

1 annualized O&M expense proposed by Staff with \$5,215,033 representing  
2 Goldendale test year O&M, excluding major maintenance and adjusted for  
3 known and measurable differences between Mint Farm operations and  
4 Goldendale.

- 5 • Sumas: Replace \$3,495,336 O&M expense proposed by Staff with \$3,594,194  
6 O&M (actual O&M expense for the most recent twelve-month period,  
7 November 2008 through October 2009, less major maintenance of \$70,076).

8 **Q. What is the net effect of these corrections on gas generation production**  
9 **O&M costs?**

10 A. The net effect is a reduction of \$1.9 million in gas generation production O&M  
11 costs from Staff's proposal.

12 **C. PSE's Management of Maintenance for Gas Generation Facilities**

13 **Q. Please explain the computer maintenance management system ("CMMS")**  
14 **program associated with the Company's gas generation facilities.**

15 A. The current CMMS project is an add-on module to the Company's main business  
16 software SAP. This CMMS module is capable of tracking and providing  
17 information for technical asset management, maintenance planning and execution,  
18 preventive and predictive maintenance, reliability-centered maintenance, parts  
19 and services procurement, inventory management, employee and contractor  
20 management, asset accounting and maintenance budgeting, and asset performance  
21 analysis.

1 **Q. How did the Company perform these asset management functions prior to**  
2 **the implementation of the SAP CMMS program?**

3 A. Many of the recently acquired gas generation projects used some form of CMMS  
4 prior to being acquired by the Company. For example, both Goldendale and  
5 Sumas used the MAXIMO CMMS program under the previous owners. Under  
6 previous ownership, the Encogen Generating Station used the MAINSAVER  
7 CMMS program. PSE legacy plants have most recently used WINTERCRESS  
8 CMMS program.

9 **Q. Why did the Company choose to switch from MAXIMO CMMS to the SAP**  
10 **CMMS?**

11 A. The MAXIMO CMMS program would have required additional end user's  
12 license fees, whereas PSE already owned the software and user's licenses  
13 associated with the SAP CMMS program. Also, the SAP CMMS program is fully  
14 supported by PSE's main business software company. Further, it is possible to  
15 directly integrate SAP CMMS with the SAP business software platform, which  
16 the Company presently uses. This will enable better maintenance planning and  
17 scheduling by integration with existing SAP modules such as inventory  
18 management and materials procurement.

19 For the reasons stated above, PSE made the decision to switch from the other  
20 CMMS programs to SAP-CMMS.

1 **D. PSE's Response To Proposals Regarding Generation Plant**

2 **A. Mint Farm**

3 **Q. How has Mint Farm been operating since PSE acquired the plant?**

4 A. Mint Farm has operated very well since PSE brought the plant on-line in January  
5 2009. Contrary to Public Counsel witness Scott Norwood's claim that Mint Farm  
6 does not appear to meet the baseload capacity factor standard of RCW 80.80.060,  
7 Mint Farm is designed and intended to run at an average capacity factor that  
8 exceeds the statutory baseload standard. As stated in the Prefiled Direct  
9 Testimony of David Mills, Exhibit No. DEM-1CT, Mint Farm is intended to run  
10 according to economic dispatch conditions, which means it will be operated as  
11 baseload generation except for times when equivalent power could be purchased  
12 at a lower cost in the market. As a matter of fact, for the period July 2009  
13 through October 2009, Mint Farm's capacity factor has exceeded [REDACTED].

14 **Q. What is the status of the facility upgrades to bring the plant up to Operating**  
15 **Standards?**

16 A. All of the Mint Farm upgrades will be completed by the end of 2009 except for  
17 the Steam Turbine Control upgrades that will be completed concurrently with the  
18 normal spring outage of the plant. The total cost of the upgrades to bring Mint  
19 Farm up to Operating Standard is [REDACTED] million, nearly [REDACTED] million less than  
20 estimated for the May 2009 GRC filing.

REDACTED  
VERSION

1 **Q. Do you agree with Commission Staff that PSE “should be ordered to**  
2 **perform a flood potential hazard assessment to discover the current dike**  
3 **system that protects Mint Farm property”?**

4 A. No. As Mr. Garratt discusses in his Prefiled Rebuttal Testimony, Exhibit No.  
5 RG-53HCT, Mint Farm due diligence identified that Mint Farm is located in the  
6 500 year flood plain, and a 2007 U.S. Army Corps of Engineers document  
7 identifies that the levees in Dike District 1, the District where Mint Farm is  
8 located, are in good condition and well maintained.

9 **Q. Do you agree with Staff’s recommendation that PSE develop a flood**  
10 **contingency plan?**

11 A. No. PSE management believes the current Emergency Preparedness and Fire  
12 Protection plan adequately address flood evacuation at the plant, given the  
13 minimal likelihood that a flood event will occur at Mint Farm. Please see PSE’s  
14 Response to WUTC Staff Data Request No. 177, Exhibit No. LEO-15. Because  
15 Mint Farm is located in a 500-year flood plain and the levees are built on average  
16 three feet higher than the projected 500-year water level, there is no more than a  
17 0.2% annual chance that there will be a flood event at the plant. Should a major  
18 flood event occur at Mint Farm, PSE’s property insurance of the plant will cover  
19 the cost of flood damage over and above PSE’s deductible.

1           **B.     Hopkins Ridge**

2           **Q.     In her testimony on behalf of Staff, Ms. Breda proposes a reduction of**  
3           **\$731,531 to the Company’s request for O&M expense related to the Hopkins**  
4           **Ridge wind facility and Hopkins Ridge Infill project. Is this adjustment**  
5           **appropriate?**

6           A.     No. Ms. Breda proposes the removal of all forecast escalation from the  
7           Company’s rate request related to the Hopkins Ridge service agreement with  
8           Vestas American Wind Technology (“Vestas”) and a revised cost adjustment at  
9           the end of the current Vestas service agreement term – November 2010. This  
10          proposed adjustment removes known and measurable costs for this facility.

11          The Company prepares O&M budgets for every generating asset to maintain a  
12          high standard of personnel safety, appropriate equipment availability and  
13          reliability, robust environmental compliance and stewardship activities, and to  
14          optimize risk and ongoing equipment lifecycle expenditures. These budgets are  
15          carefully prepared in consideration of the foregoing objectives and actual  
16          operating experience, and the budgets account for both known and foreseeable  
17          costs plus the fees necessary to satisfy those objectives. Such a significant  
18          reduction to the Company’s allowed recovery for O&M could negatively impact  
19          PSE’s ability to meet its performance objectives. The Company disagrees that  
20          escalation costs specifically defined in a fully executed contract, plus pre-  
21          negotiated performance incentives and expected cost adjustments for the Vestas

1 service agreement are not known and reasonably measurable. As proposed,  
2 Staff's recommendation is a cost reduction strategy that does not properly match  
3 revenues and expenses in the rate year for these machines.

4 **Q. How is fee escalation determined in the Hopkins Ridge Vestas service**  
5 **agreement?**

6 A. The year-over-year increase in the turbine maintenance fee is tied directly to the  
7 Consumer Price Index – Urban (“CPI-U”) published by the U.S. Bureau of Labor  
8 Statistics (“Bureau”). As soon after the Bureau completes its seasonal rate  
9 adjustments and finalizes the annual rate, that percentage change is applied to the  
10 prior year's fixed contract amount to determine the fixed contract amount for the  
11 coming year.

12 **Q. How has the CPI-U escalation rate changed since the Vestas service**  
13 **agreement was signed?**

14 A. The Hopkins Ridge Vestas service agreement was signed March 7, 2005.  
15 Contract fee escalation has since increased as follows: 2006 CPI-U Escalation:  
16 3.7%, 2007 CPI-U Escalation: 2.4%, 2008 CPI-U Escalation: 4.3%, 2009 CPI-U  
17 Escalation: 0.0%. Thus, the average annual escalation since wind turbine  
18 services began at Hopkins Ridge has been 2.6%.

19 **Q. What escalation rate did the Company assume in preparing its 2009 rate**  
20 **request?**

1 A. The CPI-U escalation rate for the Hopkins Ridge Vestas contract was assumed to  
2 be 3.0% each year in 2009, 2010, and 2011. The Hopkins Ridge O&M costs have  
3 been updated using the Company's standard Global Insight inflation forecast  
4 (1.6% in 2010 and 1.7% in 2011). This inflation forecast has also been used to  
5 pro form long-term O&M costs for the Wild Horse expansion.

6 **Q. What accounts for the large increase in the cost of the Vestas Hopkins Ridge**  
7 **service agreement in December 2010 and beyond?**

8 A. The original five-year term of the Vestas Hopkins Ridge service agreement ends  
9 in November 2010. As stated above, the Vestas service agreement was signed in  
10 March 2005 and provides a very advantageous fee structure that has not been seen  
11 since that time. After the end of the service term in November 2010, Vestas will  
12 provide no further warranty or turbine service. Service costs are rising due to a  
13 number of factors, including: the unique nature of wind turbine service  
14 requirements, its reliance on new technology, a generally young and developing  
15 workforce, major components sourced from third party or non-original equipment  
16 manufacturer suppliers, and the rapid pace of fleet utilization and maturity. Each  
17 successive negotiation with Vestas has resulted in increased fees for service and  
18 maintenance. As a result, the Company used its most recent fee negotiation for  
19 the Wild Horse expansion as a proxy for the service fees expected once the  
20 original Hopkins Ridge service term expires in 2010. That fee represented the  
21 best information available on wind turbine services pricing at the time, and  
22 [REDACTED] per turbine, per year, is used for the last four months of the rate year.

1 **Q. Is that fee still reasonable given the current operating characteristics of these**  
2 **turbines?**

3 A. Yes. The Company has been exploring a renewal of its service and maintenance  
4 agreement with Vestas to cover the post-term period. As the wind turbines  
5 continue to provide reliable energy, accumulate additional wear and tear, and  
6 exhibit the effects of aging, additional repairs and minor technology  
7 improvements will be required to optimize lifecycle cost. For maintenance  
8 services starting in 2010, the current Vestas service fee quotation is [REDACTED] per  
9 turbine per year. This is the most current available service pricing, and this fee  
10 has been used to update long-term facility O&M costs.

11 **Q. The Company has explained why it disagrees with the proposed disallowance**  
12 **of escalation required in a contract and planned cost adjustments for the**  
13 **Vestas service agreement. Would you explain why the Company disagrees**  
14 **with the proposed disallowance of infrastructure maintenance and royalty**  
15 **costs?**

16 A. Yes. The foregoing testimony rebutting Ms. Breda's proposed disallowance for  
17 the Hopkins Ridge Vestas contract applies equally to her proposal to disallow  
18 required escalation and planned increases in Vestas service fees related to the  
19 Hopkins Ridge Infill facility. These reductions are inappropriate for the same  
20 reasons stated earlier in my rebuttal testimony. However, the Company also  
21 disagrees with the proposed disallowance of foreseeable backfeed power costs,

1 infrastructure maintenance costs, and landowner royalty payments. Each deserves  
2 additional comment.

3 **Q. What is backfeed power, and why is it included in the Company's pro**  
4 **formed O&M budget for the Hopkins Ridge Infill wind facility?**

5 A. Both the Hopkins Ridge wind facility and the Hopkins Ridge Infill project are  
6 connected to the Bonneville Power Administration ("BPA") transmission system.  
7 The turbines connect to the project substation via an underground electrical  
8 collection system and from the substation to BPA via an interconnecting power  
9 line. When the wind is blowing above nine miles per hour, the wind turbines  
10 generate electricity to serve their own operational needs and supply energy to the  
11 BPA system for transmission to the Company's system. On those occasions when  
12 the wind is blowing at less than nine miles per hour, the wind turbines  
13 automatically stand by and wait for wind conditions to improve. This standby  
14 condition maintains each wind turbine in readiness condition to immediately  
15 begin generating power. In this condition the turbine control system, step-up  
16 transformer, hydraulic system, lubrication system, and cooling system all  
17 consume a small amount of electrical energy. This consumptive load is  
18 sometimes called station service load or backfeed power, and is provided and  
19 metered by BPA and billed to the Company by the Columbia Rural Electric  
20 Association. Increasing the number of turbines at the facility results in an  
21 increase in need for backfeed power demand. This demand is a known and  
22 foreseeable consequence of adding turbines to the Hopkins Ridge Infill wind

1 facility. Backfeed power costs are the subject of an electrical supply contract  
2 with the Columbia Rural Electric Association and are, thus, neither optional nor  
3 speculative.

4 **Q. What is infrastructure maintenance cost, and why is it included in the**  
5 **Company's pro formed O&M budget for the Hopkins Ridge Infill wind**  
6 **facility?**

7 A. In order to construct the Hopkins Ridge Infill wind project, additional roads,  
8 crane pads, turbine foundations, fiber optic communication lines, and  
9 underground electrical collection cables were built. Based on the experience  
10 gained from operating the Company's wind facilities and on prudent industry  
11 practice, routine infrastructure maintenance costs are a foreseeable expense and  
12 are included in the Company's rate request for the Hopkins Ridge Infill project.  
13 Failure to provide Vestas service access to the wind turbines in winter, to provide  
14 adequate storm water management in spring, to repair broken communication or  
15 electrical lines, to reduce project fire risk by spraying nearby weeds, or to inspect  
16 and maintain wind tower foundation bolts could all have deleterious  
17 consequences on the Company's safety, reliability, environmental and lifecycle  
18 risk objectives. The cost of infrastructure maintenance is a known and  
19 foreseeable consequence of adding turbines to the Hopkins Ridge Infill wind  
20 facility.

1 **Q. Why were production royalty payments to landowners recommended for**  
2 **disallowance, and why are they included in the Company's pro formed O&M**  
3 **budget for the Hopkins Ridge Infill wind facility?**

4 A. Staff proposes that all pro forma adjustments to the Company's rate request that  
5 involve a forecast, budget, or projection be removed. That apparently includes  
6 easily known and foreseeable contract and infrastructure costs, as discussed  
7 previously, but also appears to include contractual obligations such as production  
8 royalties. The Company does not own any of the real estate beneath the Hopkins  
9 Ridge Infill wind facility, but instead holds lease agreements with project  
10 landowners. Through these leases, landowners grant PSE permission to construct  
11 and operate wind turbines on their land. In exchange for that permission, the  
12 landowners are compensated with a stipulated royalty payment tied to the actual  
13 production of electrical energy on their land. This royalty is a requirement of the  
14 lease agreement and does not represent an optional project expenditure. If  
15 seasonal and annual energy production from the wind facilities are appropriately  
16 forecast in resource portfolio models, then pro formed royalties tied to the same  
17 energy forecast are appropriate in determining production O&M cost. Under Ms.  
18 Breda's approach to implementing pro forma adjustments, the full benefits of the  
19 low cost power are used in setting power costs yet the associated costs of  
20 operating the plant are not. This is clearly a mismatch of revenues and costs.

1 **III. WILD HORSE PRODUCTION O&M**

2 **Q. In her testimony, Ms. Breda proposes a \$434,980 reduction of the Company's**  
3 **request for O&M expense related to the Wild Horse wind facility. On what**  
4 **basis is this reduction proposed?**

5 A. Ms. Breda proposes the removal of all forecast escalation from the Company's  
6 rate request related to the Wild Horse service agreement with Vestas.

7 **Q. Is the proposed reduction a reasonable adjustment?**

8 A. No. As stated with respect to Ms. Breda's proposed Hopkins Ridge and Hopkins  
9 Ridge Infill disallowance, the Company prepares O&M budgets for every  
10 generating asset to maintain a high standard of personnel safety, appropriate  
11 equipment availability and reliability, robust environmental compliance and  
12 stewardship activities, and to optimize ongoing risk of equipment lifecycle  
13 expenditures. These budgets are carefully prepared around the foregoing  
14 objectives and actual operating experience; they account for both known and  
15 foreseeable costs and fees necessary to satisfy those objectives. The Company  
16 disagrees that escalation specifically defined in a contract and expected cost  
17 adjustments for the Vestas service agreement are not known and measurable.

18 **Q. How is fee escalation determined in the Vestas service agreement?**

19 A. The year-over-year increase in the turbine maintenance fee is tied directly to the  
20 Gross Domestic Product Implicit Price Deflator ("GDPIPD") published by the

1 U.S. Bureau of Economic Analysis (“Bureau”). Soon after the Bureau completes  
2 its seasonal rate adjustments and finalizes the annual rate, that percentage change  
3 is applied to the prior year’s fixed contract amount to determine the fixed contract  
4 amount for the coming year.

5 **Q. How has the GDPIPD escalation rate changed since the Vestas service**  
6 **agreement was signed?**

7 A. The Wild Horse Vestas service agreement was signed September 30, 2005.  
8 Contract fee escalation has since increased as follows: 2007 GDPIPD Escalation:  
9 0.0% (per contract), 2008 GDPIPD Escalation: 3.2%, 2009 GDPIPD Escalation:  
10 2.7%, 2010 GDPIPD Escalation: 0.6%. Thus, the average annual escalation since  
11 wind turbine services began at Wild Horse has been 2.95%.

12 **Q. What escalation rate did the Company assume when preparing its 2009 rate**  
13 **request?**

14 A. The GDPIPD escalation rate for the Wild Horse Vestas contract was assumed to  
15 be 3.0% each year in 2009, 2010, and 2011. The Wild Horse O&M costs have  
16 been updated using the Company’s standard Global Insight inflation forecast  
17 (1.6% in 2010 and 1.7% in 2011). This inflation forecast has also been used to  
18 pro form long-term O&M costs for the Wild Horse expansion.

19 **Q. Will there be a large planned increase in the Vestas Wild Horse service fee**  
20 **during the rate year?**

1 A. No. The original five-year term of the Vestas Wild Horse service agreement ends  
2 in December 2011, beyond the end of the rate year.

3 **Q. If the Commission were to provide rate recovery on the basis of these**  
4 **forecasts, budgets and pro formed expenditures, what assurance can the**  
5 **Company provide that these are true and correct costs?**

6 A. As stated earlier in my rebuttal testimony, production O&M for the wind projects  
7 is determined on the basis of safety, reliability, environmental, and lifecycle risk  
8 objectives. The only costs forecast, budgeted, or pro formed for the facilities are  
9 those that are known and/or foreseeable, and necessary to the successful operation  
10 of the project. Comparing the forecast rate request from PSE's most recent power  
11 cost only rate case, Docket No. UE-070565, with actual O&M costs from the rate  
12 year period for Wild Horse provides a credible assessment of the Company's  
13 success at budgeting wind facility O&M and executing on its plan. By way of  
14 example, in 2007 the Commission granted the Company [REDACTED] in  
15 production O&M to operate and maintain the Wild Horse wind facility for the rate  
16 year September 2008 to August 2009. Actual expenditures during the same  
17 period were [REDACTED]. Thus, expenditures for the Wild Horse project were  
18 within 1.8% of the cost recovery requested.

**REDACTED  
VERSION**

1                                   **IV.     WILD HORSE EXPANSION PRODUCTION O&M**

2     **Q.     In her testimony, Ms. Breda proposes adjustment of the Company’s request**  
3           **for O&M expense related to the Wild Horse expansion wind facility by**  
4           **\$709,625. On what basis is this reduction proposed?**

5     A.     Ms. Breda proposes to remove all forecast escalation from the Company’s rate  
6           request related to the Wild Horse expansion service agreement with Vestas,  
7           additional project management staff, and all other requested and foreseeable costs  
8           related to operations and maintenance of the infrastructure, including project  
9           development royalties.

10    **Q.     Is the proposed reduction a reasonable adjustment?**

11    A.     No. As stated above with respect to her proposed adjustment of Wild Horse  
12           Vestas service agreement fees, the Company prepares O&M budgets for every  
13           generating asset that supports the operating standards discussed earlier.

14    **Q.     Does the Company have any further objections with the proposed**  
15           **disallowance of infrastructure maintenance and royalty costs?**

16    A.     Yes. The Company disagrees with Ms. Breda’s proposed disallowance of the  
17           additional management staff, foreseeable infrastructure maintenance costs, and  
18           project development royalty payments. The Company’s concerns regarding the  
19           disallowance of infrastructure maintenance costs and royalties have been stated  
20           previously in this testimony and will not be repeated here. However, some

1 additional comments apply to the proposed disallowance of Wild Horse  
2 expansion project expenses.

3 **Q. Why is additional management staffing included in the Company's pro**  
4 **formed O&M budget for the Wild Horse expansion?**

5 A. Unlike the central location at the Hopkins Ridge wind facility, the location of the  
6 Wild Horse operations and maintenance building is near the southern boundary of  
7 the facility. Since the expansion site was located beyond the northern boundary  
8 of the original Wild Horse wind facility, drive times from the O&M building are  
9 routinely 30-45 minutes to the first expansion turbine. The combination of longer  
10 drive times, additional infrastructure for 22 new turbines, additional need for  
11 environmental monitoring of this new area, additional oversight of a larger Vestas  
12 maintenance crew, and increased site security needs does require additional  
13 workload greater than could be absorbed by the existing staff. One new team  
14 member, a Project Coordinator, has been added to manage the increased  
15 workload. The Project Coordinator is responsible for coordination of logistics  
16 and resources, provides inspection and oversight in support of the Plant Manager,  
17 manages the field relationship between Vestas and other service providers and the  
18 Company's internal departments, and reports on the status of maintenance or  
19 improvement projects. This one additional staff member has helped the Wild  
20 Horse team to realign workloads and improve their facility management  
21 effectiveness.

1 **Q. What is infrastructure maintenance cost and why is it included in the**  
2 **Company's pro formed O&M budget for the Hopkins Ridge Infill wind**  
3 **facility?**

4 A. In order to construct the Wild Horse expansion wind project, additional roads,  
5 crane pads, turbine foundations, fiber optic communication lines, and  
6 underground electrical collection cables were built. In addition, a new bay has  
7 been added in the existing substation complete with new switchgear, relaying, and  
8 main step-up transformer. Based on the experience gained from operating the  
9 Company's wind facilities and on prudent industry practice, routine infrastructure  
10 maintenance costs are certainly a foreseeable expense and are included in the  
11 Company's rate request for the expansion project. The cost of infrastructure  
12 maintenance is a known and foreseeable consequence of adding turbines to the  
13 Wild Horse expansion wind facility.

14 **Q. Why were development royalty payments recommended for disallowance,**  
15 **and why is it included in the Company's pro formed O&M budget for the**  
16 **Wild Horse expansion wind facility?**

17 A. Ms. Breda proposes that all pro forma adjustments to the Company's rate request  
18 that involve a forecast, budget, or projection be removed. While the Company  
19 owns the real estate beneath the Wild Horse expansion wind facility, it holds  
20 ongoing payment obligations with the original project developers. In the  
21 development rights transaction that brought Wild Horse to the Company, the

1 project developers retained a stipulated royalty payment provision tied to the  
2 actual production of electrical energy from the facility. This royalty is a  
3 requirement of the development agreement and does not represent an optional  
4 project expenditure. It is known and measurable as the generation used in setting  
5 power costs.

6 **Q. Ms. Breda uses PSE's Response to Staff Data Request No. 143(b) to support**  
7 **her statement that PSE is not consistent in its use of forecasts for power**  
8 **costs, and “actual results can vary considerably from a forecast (italics**  
9 **added)”. Does the Company agree?**

10 A. No. Ms. Breda does not provide PSE’s full response. The response stated that  
11 the differences were caused by an error in the escalation factors. The error was  
12 only \$72 thousand for 2010 and \$56 thousand in 2013/2014, but Ms. Breda  
13 implies that PSE knowingly used different assumptions. The simple  
14 mathematical error in the Company's spreadsheets caused only minor differences,  
15 which PSE stated it would update upon rebuttal if the spreadsheets were to be  
16 used.

## 17 V. CONCLUSION

18 **Q. Does that conclude your prefiled rebuttal testimony?**

19 A. Yes.
