2 **PREFILED DIRECT TESTIMONY (NONCONFIDENTIAL) OF**
3 **MARGARET F. HOPKINS**

4 **I. INTRODUCTION**

5 **Q. Please state your name and business address.**

6 A. My name is Margaret F. Hopkins. My business address is 355 110th Ave. NE,
7 Bellevue, Washington 98004.

8 **Q. By whom are you employed and in what capacity?**

9 A. I am employed by Puget Sound Energy (“PSE”) as Vice President and Chief
10 Information Officer.

11 **Q. What are your duties as Vice President and Chief Information Officer?**

12 A. I am responsible for leading PSE’s information technology (“IT”) and cyber
13 security program and building and managing the infrastructure, technologies,
14 systems, and data that enable PSE to support our customers and achieve business
15 success.

16 **Q. Have you prepared an exhibit describing your education, relevant**
17 **employment experience, and other professional qualifications?**

18 A. Yes. Please see the Prefiled Direct Testimony of Margaret F. Hopkins,
19 Exh. MFH-2, for an exhibit describing my education, relevant employment
20 experience, and other professional qualifications.

1 **Q. Please summarize the purpose of your testimony.**

2 A. My testimony provides an overview of PSE's IT strategy and of the technology
3 investments placed in service between October 1, 2016 and December 31, 2018.
4 My testimony also addresses the IT investments PSE intends to pro form into the
5 test year for this case through June 30, 2019, and I share a forward looking
6 prospective of the IT work anticipated through the rate year in accordance with
7 PSE's corporate strategy and business plan.

8 **II. PSE IS APPROPRIATELY INVESTING IN INFORMATION**
9 **TECHNOLOGY TO SUPPORT CUSTOMER NEEDS NOW AND**
10 **IN THE FUTURE**

11 **Q. Please provide a high-level overview of PSE's strategy for making technology**
12 **investments.**

13 A. Utilities are undergoing tremendous change and transformation. Rapid
14 advancements in IT have altered the approaches utilities use to operate and
15 transform, as they are increasingly dependent on technology solutions to enable
16 business objectives such as reliability, resource efficiency and customer service.
17 Technology assets are as foundational as the classic pipes and wires that deliver
18 service to our customers, and are inextricably linked to advancing, securing, and
19 enabling the day-to-day operation of our gas and electric service.
20 Digitalization, or the use of digital technologies to transform business operations,
21 is reshaping how utilities operate and is necessary to meet customer needs more
22 efficiently and responsively. Distributed generation, grid modernization, data-
23 driven customer expectations, mobile field workers, predictive maintenance

1 schedules, and customer self-service, are all examples of how digital
2 modernization enables greater efficiency and increased speed to improve
3 customer satisfaction.

4 **Q. Has digital modernization impacted customer behavior?**

5 A. Yes. The evolution of digital customer engagement has changed customer
6 behaviors and expectations. Customers demand information on their energy
7 usage, payment history and service options, and they want the ability to interact
8 with their utility 24/7, on their own terms, and via the communication channel(s)
9 they prefer. Those channels can include online, mobile, interactive voice response
10 systems, or simply a telephone call to an agent. Regardless of channel, customers
11 expect to have the same (consistent) information available to easily transact
12 business with PSE. The Get to Zero initiative, as set forth in the Prefiled Direct
13 Testimony of Joshua J. Jacobs, Exh. JJJ-1T, was launched in response to these
14 changing expectations with the ultimate objective of improving the end-to-end
15 customer experience for all PSE customers.

16 Safe and reliable delivery of energy is foundational to customer expectations and
17 to PSE's digital efforts. PSE's IT strategy builds the foundational capabilities,
18 architectures and platforms needed to support digital transformation through the
19 automation and modernization of existing/legacy systems, to align with new
20 digital technologies, and to stay in line with customer expectations for reliability,
21 efficiency and clean energy. PSE's digital initiatives such as Advanced Meter
22 Infrastructure, as discussed in the Prefiled Direct Testimony of Catherine A.

1 Koch, Exh. CAK-1T, and the Energy Management System Upgrade (discussed
2 later in this testimony), directly support improvements to the reliability of our
3 electric grid and gas service.

4 **Q. Are there any risks or challenges associated with digital modernization?**

5 A. Yes. While the transition to digital solutions creates opportunities and
6 improvements for customers, it also introduces risks and challenges that must be
7 taken into consideration with each IT investment.

8 Risks:

9 The cyber threat to the electric grid, both nationally and globally, has driven a
10 change in how IT solutions are architected for utilities. Every system must be
11 designed not only to meet business needs, but to meet them in a secure manner
12 that protects the grid and maintains the privacy of customers' and employees'
13 sensitive information. The Data Center and Disaster Recovery initiative
14 (discussed later in this testimony) directly supports PSE's efforts to protect PSE's
15 critical assets and information from cyber-attacks and ensures the reliability and
16 resiliency of the systems that support our gas and electric service should we
17 experience a localized catastrophic event.

18 Challenges:

19 The significant increase in technology investment to support the business needs
20 has created challenges for PSE from an expense and regulatory perspective:

1 • Increased expense related to “cloud” and Software as a Service (“SaaS”)
2 agreements: Cloud and SaaS have become necessary in providing
3 technology solutions to meet business challenges for two reasons. First,
4 many technology vendors are forcing companies to host technology
5 solutions in the cloud by eliminating the option to host in their own data
6 centers. Second, IT often looks to cloud computing and SaaS solutions to
7 provide more affordable, timely and reliable service, which in turn
8 benefits our customers. While cloud offerings are typically more cost
9 effective, migration to cloud is driving an increase in operating expenses
10 at an accelerated pace, as little progress has been made to improve
11 regulatory treatment for cloud computing arrangement across the utility
12 industry.

13 • Increased hardware and software maintenance costs: As new technology
14 solutions (and the associated hardware and software assets) are deployed
15 to meet business needs, maintenance agreements must be purchased to
16 ensure vendor support, system updates and ongoing security patches.
17 Without these maintenance agreements, we cannot guarantee the
18 reliability, security, and recoverability, of these systems.

19 • The impact of regulatory lag is amplified as the proportion of IT capital
20 spending has increased relative to our total capital spend: Traditional
21 regulatory recovery mechanisms were developed to support deployment of
22 assets with longer life spans. Technology investments typically have a
23 depreciable life of ten or less years and most often three to five years. The

1 typical 27-month regulatory lag has a greater impact on these short-lived
2 assets than traditional transmission and distribution investments, resulting
3 in earnings erosion.

4 **Q. How has PSE's IT investment strategy responded to these risks and**
5 **challenges?**

6 A. Given the aforementioned context, PSE's overarching IT investment strategy aims
7 to provide cost effective secure technology solutions that improve grid and gas
8 reliability, meet evolving customer expectations, enable clean energy solutions,
9 and support key business objectives. We adhere to a set of established technology
10 principles to guide our decisions:

- 11 • Plan: Technology roadmaps and plans are developed at the enterprise and
12 business levels, balancing risk, function, and the future needs of PSE and
13 its customers. These plans align Company and customer needs with
14 supporting technology solutions and influence the priority and timing of
15 technology investments for current and future years.
- 16 • Acquire: A business case, known as a Corporate Spending Authorization
17 ("CSA") document, is developed by management to support the need for
18 each technology initiative. The CSA outlines the business problem,
19 evaluates various solutions, and assesses the risk, cost and benefits
20 associated with each option. Total cost of ownership is considered at all
21 decision points, with a bias toward cost effectiveness and optimization of
22 prior technology investments. We make every effort to minimize cost by

1 leveraging existing technology assets and maximizing their use. If an
2 existing IT asset meets the majority of business and/or technical
3 requirements, we will build upon the existing platform to the extent
4 possible. By leveraging existing assets and vendor relationships, we
5 optimize cost through volume discounts and lower integration costs. PSE's
6 SAP platform is a good illustration of this principle. By building upon the
7 SAP platform to implement our Financial Transparency and Improvement
8 Program, as set forth in the Prefiled Direct Testimony of Matthew R.
9 Marcellia, Exh. MRM-1T, we were able to capitalize on the existing
10 platform and integrate more easily into the current IT infrastructure. This
11 keeps implementation costs in line and allows us to use in-house skill sets
12 familiar with the technology to deliver solutions more quickly. When an
13 existing system does not meet business requirements, we evaluate multiple
14 options with a preference toward cloud or "purchased" products. In doing
15 so, we lower development and maintenance costs, align with industry best
16 practices, and increase speed of implementation. We also avoid
17 developing highly customized systems that are difficult and costly to
18 maintain. All purchases follow a standard contracting and procurement
19 process to obtain the best value for PSE and our customers.

- 20 • Design: Once selected, we design each system to meet the stated business
21 requirements and leverage out-of-the box capabilities to minimize
22 customizations and to avoid over-reaching or gold plating with extraneous
23 functionality. This helps to keep support and maintenance down and

1 lowers the cost of future upgrades. Cyber security, data privacy,
2 availability, and disaster recovery capabilities are paramount, and
3 designed into the system in accordance with PSE's security and
4 compliance obligations such as the North American Electric Reliability
5 Corporation Critical Infrastructure Protection ("NERC/CIP") standards.
6 We architect for reuse, adaptability, growth, ease of operation and speed,
7 and standardize and consolidate where possible. We also embed data
8 governance and data management best practices into our design to ensure
9 that customer, asset, and employee data is protected and accurate. We
10 apply this rigor across all technology platforms to achieve maximum value
11 from prior investments and to minimize the overall growth of ongoing IT
12 expenses.

- 13 • Operate and Secure: Once operational, we properly maintain and keep our
14 assets current. Technical currency is necessary to keep the systems
15 available and secure. Hundreds of vulnerabilities are introduced into the
16 technology landscape each month, and all systems must be patched to
17 ensure the proper security protections are in place, particularly as we see
18 an increase in the viruses and malware specifically targeted at the grid.
19 These patches are not built to support out-of-date systems, so we must
20 invest in upgrades on a continual basis. We follow security best practices
21 and adhere to corporate policy and compliance obligations to protect PSE
22 systems and data from unauthorized use and disclosure. We benchmark
23 our security practices against the National Institute of Standards and

1 Technology framework—the recommended cyber security framework for
2 critical infrastructure as outlined in Executive Order 13636.¹ This
3 framework allows us to assess the maturity of our security protections and
4 identify gaps that require additional efforts and investment to further
5 strengthen our security posture. Our Data Center and Disaster Recovery
6 program (discussed in more detail below) is an example of an IT
7 investment put in place to manage cyber and business continuity risk, and
8 to protect the systems and data critical to PSE’s gas and electric
9 operations.

10 **Q. What process does PSE undertake before purchasing new systems**
11 **applications and infrastructure?**

12 A. Guided by the principles outlined above, PSE conducts cost/benefit analyses in
13 advance of incremental system purchases. We work with technology vendors that
14 provide business solutions that create long-term scale economies and competitive
15 advantages for PSE’s customers. Through PSE’s contract services group, we
16 acquire technology that is competitively priced, reliable, and relevant to the utility
17 industry and best serves customers. The competitive bid process allows us to
18 enable scale economies in pricing and ongoing maintenance, thereby providing a
19 lower total cost of ownership on behalf of PSE’s customers.

¹ <https://obamawhitehouse.archives.gov/the-press-office/2013/02/12/executive-order-improving-critical-infrastructure-cybersecurity>.

1 **Q. What is IT management’s role in the purchasing process?**

2 A. All technology purchases require the oversight of an IT Manager. The manager is
3 involved in the evaluation and analysis of the criteria used during the bid process,
4 the selection of the technology, and final approval. The formal spend
5 authorization process is automated through our procurement system and uses
6 built-in requirements to escalate to the IT Director or Chief Information Officer
7 level for additional approval, when total spend exceeds pre-defined corporate
8 limits.

9 **Q. Please elaborate on the Contract Services procurement process and the**
10 **cost/benefit analyses PSE uses for systems acquisitions.**

11 A. For all new systems, cost/benefit analyses typically include a project overview
12 (e.g. problem statement, proposed solution, alternatives evaluated, etc.) and a
13 vendor evaluation conducted through PSE’s Contract Services procurement
14 process. Form and format for such evaluations may vary based on the size and
15 complexity of the proposed systems.

16 **Q. What are PSE’s major systems initiatives?**

17 A. As mentioned above, PSE is engaged in several ongoing business transformation
18 efforts with significant technology components:

- 19 • “Get to Zero (“GTZ”) Initiative: GTZ is PSE’s customer-focused, digital
20 transformation initiative. This six-year initiative (2016-2021) is transforming
21 the customer service experience with expanded and consistent digital self-

1 service options, updating or replacing aging technologies, removing obstacles
2 for customers, providing proactive communications, and quickly anticipating
3 and solving problems before they occur. GTZ has a strong emphasis on
4 automation and process improvements in the customer-touching areas of data
5 analytics, data management, work planning, scheduling and dispatch. As
6 referenced previously, more detail on the GTZ initiative is provided in the
7 Prefiled Direct Testimony of Joshua J. Jacobs, Exh. JJJ-1T.

- 8 • Advanced Meter Infrastructure (“AMI”): PSE’s existing Automated Meter
9 Reading (“AMR”) infrastructure, installed between 1998-2001, is approaching
10 the end of its useful life, forcing a system replacement in order to continue
11 accurate energy billing for customers. Because AMR technology is near
12 obsolescence, PSE was faced with the option to either refurbish the existing
13 AMR system with the same limiting one-way technology or transition to a
14 more up-to-date, two-way AMI. PSE elected to proceed with the installation
15 of the AMI communication network and metering equipment throughout
16 PSE’s electric and gas service territory. Installation work is underway, and
17 full deployment is expected to be complete in 2022-2023. IT is a key enabler
18 to the successful deployment of the AMI infrastructure, including the build
19 out of a core network and related hardware and software systems required to
20 securely transfer data from the meter to PSE. Additionally, to mitigate new
21 risks that may be introduced with two-way communication paths, PSE will
22 implement the AMI advance security option to facilitate greater cyber and

1 data protections at the meter. More detail on the AMI program is provided in
2 the Prefiled Direct Testimony of Catherine A. Koch, Exh. CAK-1T.

- 3 • Financial Transparency and Improvement Program (“FTIP”): FTIP
4 modernized and implemented a redesign of PSE’s financial systems,
5 processes, tools and financial structure. It also paved the way for the GTZ
6 initiative to take advantage of a more robust and capable SAP platform,
7 particularly as it relates to the capabilities being built into the Integrated Work
8 Management (“IWM”) program. More detail on FTIP is provided in the
9 Prefiled Direct Testimony of Matthew R. Marcellia, Exh. MRM-1T and the
10 IWM program is discussed in Mr. Jacob’s GTZ testimony, referenced above.
- 11 • Data Center and Disaster Recovery Program (“DCDR”): The DCDR program
12 is focused on mitigating a significant corporate risk relating to insufficient
13 disaster recovery capabilities of existing data center facilities and critical
14 systems. This program replaces PSE’s existing substandard data centers,
15 which cannot meet corporate requirements for resiliency and disaster
16 recovery, with geographically diverse, highly redundant modular facilities. It
17 also implements the infrastructure (hardware and software) needed to meet
18 availability and security requirements for day-to-day operations. Foundational
19 to this program is the implementation of disaster recovery solutions that allow
20 PSE to recover critical IT systems within 24 hours of a serious outage or
21 catastrophic event such as an earthquake or crippling cyber-attack. Additional
22 explanation on this initiative is provided later in my testimony.

1 III. TECHNOLOGY PLACED IN SERVICE

2 A. Overview

3 Q. Please provide an overview of the IT spending for which PSE seeks recovery
4 in this case.

5 A. In general, for the time period from October 1, 2016, through December 31, 2018,
6 PSE’s technology expenditures fall into two main categories:

7 1) System Modernization and Optimization – This category represents capital
8 efforts required to upgrade and maintain key and critical IT application and
9 infrastructure platforms, and to ensure ongoing availability, stability, security,
10 technical currency and vendor support. By keeping applications and
11 infrastructure equipment at supported levels, PSE can continue to receive
12 critical system and security patches, take advantage of the latest features, and
13 maintain license compliance as defined by support agreements. Work under
14 the Systems Modernization and Optimization category is funded annually,
15 with proposals submitted from each of the major IT areas outlined below. The
16 IT leadership team reviews and makes funding decisions based on business
17 value and risk of each proposal.

18 The following areas are covered under this program:

- 19 • IT Applications operational work ensures the 264 applications used by
20 PSE are kept technically current and are properly maintained in
21 compliance with our vendor support agreements. This program provides
22 funding for critical applications such as the Energy Management System,

1 Gas Control System, Outage Management System, SAP systems (Finance,
2 Human Resources, Call Center, Billing, and Asset Management),
3 Metering, PSE.com, and other critical business systems.

- 4 • IT Infrastructure consists of the computing and telecommunications
5 hardware and software upon which critical business systems and
6 capabilities are built. This is largely the IT equipment housed in our Data
7 Centers (2,675 servers) and the network equipment and connectivity
8 infrastructure (fiber, radio, microwave) that enable telecommunications
9 throughout our service territory.
- 10 • IT Security and Risk focuses on cyber risks and ensures vulnerabilities are
11 mitigated in alignment with the rapidly changing security landscape.
12 PSE's cyber security program is based on the same national standards
13 followed by leading companies in the energy and defense industries and is
14 assessed annually against those standards by external security firms. Our
15 annual assessment is utilized to evaluate our cyber security posture to
16 ensure cyber investments are properly identified and funded under this
17 category. Without this focus, we would not have been able to successfully
18 protect against the millions of vulnerabilities that have been introduced to
19 the IT landscape over the last several years. During this test period alone,
20 241 patches covering over 3,000 vulnerabilities were released by
21 Microsoft for the systems we operate.

22 Detailed testimony on the major initiatives included in this category are
23 provided later in this testimony.

1 2) New systems – This category includes costs associated with acquisition,
2 development and installation of new systems based on business and
3 operational needs. This work is primarily related to net-new additions to the
4 PSE technology portfolio which introduces new maintenance and support
5 expenses, including vendor costs, contract costs, hosting or cloud-related
6 costs, and internal labor needed to ensure continued availability, resilience,
7 and security of the new asset.

8 As business areas identify technology enablement opportunities, they create a
9 business case in a CSA document to secure funding and to formalize the
10 project. This process occurs annually and is used to inform the final approved
11 IT capital budget for the subsequent year.

12 Detailed testimony for the “New Systems” projects exceeding \$10 million
13 during the period October 1, 2016 through December 31, 2018, for which PSE
14 seeks recovery, are provided in the following prefiled direct testimonies:

- 15 • GTZ is provided in the Prefiled Direct Testimony of Joshua J. Jacobs,
16 Exh. JJJ-1T;
- 17 • AMI is provided in the Prefiled Direct Testimony of Catherine A. Koch,
18 Exh. CAK-1T;
- 19 • FTIP is provided in the Prefiled Direct Testimony of Matthew R.
20 Marcelia, Exh. MRM-1T; and
- 21 • DCDR, which I address below.

1 The Second Exhibit to the Prefiled Direct Testimony of Margaret F. Hopkins,
2 Exh. MFH-3, provides a listing of all new or upgraded technology placed into
3 service after October 1, 2016, and before December 31, 2018, for which PSE
4 seeks recovery in this case.

5 **B. System Modernization and Optimization Program**

6 **Q. What types of projects are run under the Systems Modernization and**
7 **Optimization program?**

8 A. As mentioned above, work is aligned to the various departments (Infrastructure,
9 Applications, Security and Risk). Within each department the projects can be
10 further broken down into the following work types:

11 1) Technology Refresh projects – These projects undertake upgrades to
12 existing technology to keep them current and to protect PSE’s IT investments.
13 These upgrades are necessary to maintain service level requirements, security
14 patches from vendors, continued operations, and compliance with NERC/CIP
15 obligations.

16 2) Technology Growth projects – These projects support efforts needed to
17 scale core infrastructure in alignment with natural business growth and new
18 business requirements and capabilities. This growth could come in the form of
19 software licenses, storage and data growth, server expansion and
20 telecommunications bandwidth increases.

21 3) Upgrades or enhancements – These projects include upgrades and
22 enhancements to existing applications based on business requests for

1 additional functionality, software licensing and maintenance agreement
2 requirements, and new security or compliance considerations.

3 **Q. What process is used to prioritize and fund the work in this program?**

4 A. Program funds are requested annually through the corporate budgeting process. In
5 addition, IT management develops a CSA (referred to as an Operational Program
6 CSA) to support the budget request. Within IT we undertake an annual planning
7 process to prioritize and select initiatives that will be funded in the subsequent
8 year under this program. Requests are submitted via a business justification form
9 that describes the funding required and the risk associated with not doing the
10 work. Funding requests are evaluated by all IT Managers, with final decision on
11 budget allocation made during a formal review with IT Directors and the Chief
12 Information Officer.

13 **Q. What governance and oversight is in place to track performance and manage
14 budget?**

15 A. An IT Manager is aligned with each initiative in this program as the project
16 sponsor/delivery manager, and is responsible for managing to the scope, schedule
17 and budget for each individual project. The manager is also required to submit
18 monthly budget forecasts for leadership review. Additional layers of management
19 oversight are in place at the “portfolio” level to ensure effective governance over
20 the entire program. Monthly program reviews are held with all IT Managers,
21 including IT Directors, to review program status and address any project risks,
22 issues or changes.

1 **Q. What is the combined cost of the system modernization and optimization**
2 **program efforts for which you seek recovery from October 1, 2016 through**
3 **December 31, 2018?**

4 A. Approximately \$102.3 million in program work is included in this request, as
5 referenced in the Second Exhibit to the Prefiled Direct Testimony of Margaret F.
6 Hopkins, Exh. MFH-3, under the category of system upgrades. Of this, the largest
7 spend category is aligned with Infrastructure at \$55.2 million. Although the
8 majority of this spend is related to technology refresh and growth, Infrastructure
9 projects also cover security infrastructure and critical system upgrades required to
10 maintain reliability of our systems and introduce expanded functionality. As an
11 example, approximately \$8.8 million of the Infrastructure spend is related to
12 upgrading the communication equipment necessary for communications between
13 our substations and the Energy Management System. PSE's existing analog
14 system is over 25 years old, and this upgrade is required to eliminate failures in
15 aging equipment by replacing the analog system with a modernized, stable and
16 secure communications platform.

17 Applications represent the next largest category, with approximately \$33.8
18 million in spend, the majority (\$10.7 million) of which is allocated to a critical
19 system upgrade of our aging Gas Control System and work needed to prepare for
20 an upgrade to SAP HANA, the database management system on which our FTIP
21 program was built.

1 The next largest bucket of spending associated with this program is related to
2 funding required to support internal service requests (“ITSR”) from the business
3 units. This spending represents \$5.6 million and is associated with a series of
4 smaller projects that introduce high priority functional enhancements to drive
5 business improvements. IT coordinates with business leadership to prioritize and
6 approve ITSR work in accordance with their budget constraints. Monthly steering
7 committee meetings are held with each business area to monitor progress against
8 scope, schedule, and budget.

9 Finally, approximately \$7.6 million of this spending can be attributed to security
10 and compliance work. The largest spending associated with this category is
11 related to enhancements to our electronic governance, risk and compliance
12 system, which accounts for \$4.7 million of spending. Enhancements supported
13 under this spending include implementation of a risk register to track security
14 related risks, creation of templates and a repository for documenting and storing
15 disaster recovery plans, and introduction of automated capabilities needed to
16 support compliance requirements, including self-certification for NERC/CIP.

17 **C. Data Center and Disaster Recovery Program**

18 **Q. Please describe PSE’s DCDR program.**

19 A. The DCDR program is a four-year effort to mitigate a significant business
20 continuity risk associated with the critical IT systems that are essential to the safe
21 and secure operation of our electric and gas services. There are three phases to the
22 program: 1) replacement of the existing substandard Data Center facilities; 2)

1 implementation of Disaster Recovery capabilities for IT systems; and 3)
2 decommissioning of existing Data Center facilities.

3 1) Replacement of sub-standard Data Center Facilities – PSE’s IT systems

4 previously operated out of two data center facilities: Bothell and Bellevue.

5 These facilities were located 12 miles apart on the same seismic fault, creating
6 a significant business continuity risk to PSE in the event of a localized disaster
7 or a single seismic event. In addition, both facilities were substandard, as
8 neither were sufficient to meet PSE’s power, redundancy, and cooling
9 requirements to ensure the safe operation of the IT equipment. The Bothell
10 data center is positioned in a flood plain and is located on the second floor of
11 an office building, which introduces structural concerns due to the weight of
12 the IT equipment. Bothell has experienced two significant data center outages
13 directly attributed to the deficiencies noted above, causing significant impact
14 to PSE’s ability to operate. During these outages, PSE was forced to revert to
15 manual (paper) processes to answer customer calls, which negatively affected
16 SQI 5, and the Load Office also reverted to manual processes increasing risk
17 to field operations.

18 2) Implementation of Disaster Recovery capabilities for IT systems – The

19 second component of the DCDR program focuses on improving disaster
20 recovery (“DR”) capabilities for PSE’s IT systems. Of the 51 critical systems
21 running in the data centers, 19 (roughly 40 percent) did not have DR
22 capabilities. The impacts to PSE of not being able to run these systems in the
23 event of a regional or localized disaster would be broad and significant.

1 3) Decommissioning – This involves removing all equipment from the Bothell
2 and Bellevue facilities to make the space available for reuse.

3 **Q. Please describe PSE’s plan for replacing the existing data center facilities.**

4 A. The project plan is being executed in three phases:

- 5 • Phase 1: Replacement of Substandard Data Center Facilities: Phase 1
6 began in 2016 with the assessment of PSE’s needs, which led to the
7 decision to build two new data centers utilizing state of the art data center
8 modules built by Baselayer. Sites were selected, procured, and prepared
9 for the new modules. By the end of 2017, both sites were complete, with
10 the modules and network infrastructure complete and ready for application
11 migrations. The Prefiled Direct Testimony of Douglas S. Loreen,
12 Exh. DSL-1T, addresses the acquisition of the Snoqualmie Technology
13 Center that houses one of the modular data centers.

- 14 • Phase 2: Application Migration and Disaster Recovery: Upon the
15 completion of Phase 1, the focus turned to migrating the applications and
16 services from the old data centers to the new ones and testing the disaster
17 recovery capabilities. Over 200 applications were reconfigured to conform
18 to the new architecture and in many cases to establish disaster recovery
19 capabilities consistent with the policies and practices established for the
20 new data centers. Each application was migrated and tested to ensure their
21 disaster recovery plans met their time-to-recover objectives.

- 1 • Phase 3: Decommissioning: Decommissioning of the Bothell data center
2 will be complete in 2019. This includes the removal of equipment and
3 vacating of the data center space to make it available for reuse. The
4 Bellevue data center will be decommissioned at a later date to coincide
5 with the relocation of the Backup Control Center, which is currently tied
6 to the Bellevue facility.

7 **Q. What alternatives did PSE consider to replace the existing data center**
8 **facilities?**

- 9 A. In considering alternatives for the data centers, PSE utilized the following key
10 criteria: (i) resolve the risks identified by Business Continuity (e.g. both sites
11 affected by a single seismic event, flooding risk, stability of the building
12 infrastructure, application recovery, etc.); (ii) PSE's ability to control the
13 environments (site, building, environmental controls, security, etc.); (iii) PSE's
14 ability to satisfy NERC/CIP requirements; and (iv) 20-year total cost.

15 After thorough vetting of the above-mentioned criteria, the decision was made to
16 build two new modular data centers, located 80 miles apart, one in western
17 Washington near corporate headquarters, and the other in eastern Washington on
18 PSE property. This approach was the most cost effective and provided the optimal
19 solution to mitigate the seismic and facility risks, to provide the security and
20 resiliency required for business continuity, disaster recovery, and to meet
21 NERC/CIP compliance.

1 Prior to deciding on the selected option, four alternatives were considered: 1)
2 fortifying the existing data centers; 2) utilizing leased space by co-locating both
3 data centers in shared facilities; 3) a combination of a co-located facility with a
4 PSE owned data center; and 4) building PSE owned data centers using modular
5 components specifically designed for data center use.

6 1) Fortifying the existing data centers – This approach did not eliminate the
7 business continuity risks associated with the facilities residing in the same
8 seismic zone and Bothell being situated in a flood zone. Further, because the
9 existing locations were in office buildings not originally intended as data
10 centers, the limitations on power and environmental conditioning could not be
11 overcome.

12 2) Utilizing leased space by co-locating both data centers in shared facilities –

13 This approach was not selected as it did not satisfy the required NERC/CIP
14 security controls, or PSE’s ability to control the environments (site, building,
15 environmental controls, security, etc.). NERC/CIP requirements are routinely
16 adjusted to meet current conditions, and PSE’s ability to satisfy the
17 requirements could be adversely impacted by the co-location provider’s
18 decisions. PSE polled Chief Information Officers of Edison Electric Institute
19 and the American Gas Association to benchmark against the industry for
20 utilizing leased facilities. We found no other utilities using co-located data
21 centers, largely due to NERC/CIP requirements. PSE also found that leased
22 facilities were not certified to handle NERC/CIP compliance obligations,
23 posing a significant risk to the assets and potential penalties for violations.

1 3) Utilizing a combination of a co-located facility along with a PSE-owned
2 data center – Similar to Option #2, this approach was not selected as it did not
3 meet the criteria of satisfying NERC/CIP security controls, nor did it satisfy
4 PSE’s ability to control the environments (i.e., site, building, environmental
5 controls, security, etc.) for the co-location site.

6 4) Building PSE owned data centers using modular components specifically
7 designed for data center use – As described above, this approach met all
8 criteria and was the most cost-effective solution on the 20-year total cost
9 analysis.

10 The Third Exhibit to the Prefiled Direct Testimony of Margaret F. Hopkins,
11 Exh. MFH-4, provides the CSA documentation for the DCDR program.

12 **Q. Did PSE consider using hosted IT services, in which a third party provides**
13 **data processing for applications (e.g., website, billing, e-mail, accounting,**
14 **data warehousing, back-up, etc.) installed and operated from the third**
15 **party’s facilities?**

16 A. A number of PSE applications already take advantage of a hosted services model
17 (i.e. SaaS and cloud), and we anticipate further adoption of this model in the
18 future. Analysis of how to best provide services such as website, billing, email,
19 accounting, data warehousing, back-up, etc., is performed as part of the
20 technology planning function within IT. The overall design of the new data
21 centers anticipated and incorporated this gradual transition to the cloud in the
22 following ways:

- 1 • The physical footprint of the new data centers was significantly reduced
2 from that of the Bothell and Bellevue facilities—from a combined 21,273
3 square feet to 2,800 square feet;
- 4 • Rack space capacity was reduced to approximately 53 percent of that of
5 Bothell and Bellevue; and
- 6 • The modular data center option allowed us to start with the smallest
7 footprint possible (without over-building) enabling us to easily scale “just
8 in time” rather than pre-buying modules (capacity) that may go unused for
9 years. This was the most cost effective and flexible way to accommodate
10 the slowing pace of growth as the nature of providing IT services adapts to
11 new technologies and cloud-based services.

12 **Q. Are the new data centers completed and in service?**

13 A. Yes. Phase 1 (construction) and Phase 2 (migration/disaster recovery) are
14 complete. The data centers are fully operational and in service. All IT systems
15 have been migrated to the new facilities. Redundant network and
16 telecommunications paths are in place and fully operational, and full disaster
17 recovery capabilities are in place for all IT systems according to their designated
18 business continuity recovery time objectives. This is a significant step in reducing
19 PSE’s business continuity risk. Phase 3 activities (decommissioning) are in
20 progress and will continue through 2019. The overall program is roughly 95
21 percent complete.

1 **Q. What was the cost of the DCDR program?**

2 A. The costs associated with each phase are as follows:

- 3 • Phase 1: Site selection, facility construction: \$33.2 million. This figure
4 includes the cost to construct the two modular data centers located at the
5 Snoqualmie Technology Center Office and on the site of an existing PSE
6 substation in Cle Elum, Washington. The Prefiled Direct Testimony of
7 Douglas S. Loreen, Exh. DSL-1T, addresses the acquisition of the Snoqualmie
8 Technology Center building that houses the Snoqualmie Data Center.
- 9 • Phase 1: Infrastructure hardware build: \$31.2 million. This figure includes the
10 cost to purchase the network, server, storage, telecommunications and security
11 hardware and software needed to build and support the IT systems in the new
12 facilities.
- 13 • Phase 2: System Migration/Disaster Recovery: \$14.9 million. This figure
14 includes the labor required to configure, test, and migrate all IT systems to
15 operate under the new disaster recovery architecture in the new facilities.

16 **Q. How did the actual cost compare to the estimated cost?**

17 A. Phase 1 (facility construction, and infrastructure build) costs were estimated at
18 \$64.3 million, and came in .02 percent over budget with an actual cost of \$64.4
19 million. The total budget for Phase 2 (migration/disaster recovery) was originally
20 estimated at \$10 million, assuming a migration to the new facilities in a like-for-
21 like state with minimal modifications to the 264 systems planned for migration.

1 Actual spend was \$14.9 million, an increase of \$4.9 million, primarily due to
2 increased labor costs. Initial labor estimates were based on moving applications
3 into a data center environment with security and network architectures similar to
4 the prior data centers. However, as requirements for recoverability of critical
5 systems were refined, the need to modernize network and security platforms to
6 accommodate the near instantaneous recovery of critical systems drove additional
7 work in three areas:

- 8 • An architectural redesign of our network and firewall infrastructure was
9 implemented to improve recoverability time frames and security postures
10 in alignment with business continuity best practices. This change in
11 architecture drove an increase in application upgrades and modifications
12 required for the IT systems to operate under the new design;
- 13 • Actual testing was more comprehensive than planned due to the
14 complexity of the new architecture and increased requirements to certify
15 that applications met their disaster recovery requirements; and
- 16 • Additional and unplanned tasks were undertaken as part of system
17 migrations to minimize disruption to daily operations of critical systems
18 and in-flight project schedules.

19 **Q. Did PSE keep management informed during the course of the project?**

20 A. Yes. The DCDR governance structure consisted of an executive steering
21 committee and a project-level steering committee made up of IT leaders. Together

1 these teams participated in project oversight, key decision making, risk
2 mitigations, and approval of costs and changes.

3 **Q. Were there any material changes that affected the project scope, schedule or**
4 **budget?**

5 A. There were no major changes to scope or schedule, other than those associated
6 with Phase 2 (migration/data recovery), as described above.

7 **IV. TECHNOLOGY TO BE PLACED IN SERVICE**
8 **THROUGH JUNE 30, 2019**

9 **Q. What additional projects or features are expected to be implemented through**
10 **June 30, 2019, that PSE intends to pro form into the test year for this case?**

11 A. PSE intends to pro form approximately \$32.5 million in investments related to
12 GTZ as discussed in the Prefiled Direct Testimony of Joshua J. Jacobs, Exh. JJJ-
13 1T. In addition, PSE intends to pro form spending for two additional IT projects:
14 the Energy Management System upgrade and the Human Resources Technology
15 Transformation, each of which I discuss in more detail below.

16 **A. Energy Management System Upgrade**

17 **Q. Please describe PSE's Energy Management System ("EMS") upgrade**
18 **project.**

19 A. The EMS is a collection of software applications that are used for monitoring and
20 controlling PSE's power system in real-time, including the transmission system,
21 portions of the distribution system, and generating units that have the capability to

1 be remotely controlled. It is a critical system that provides the sole capability for
2 balancing generation and power interchange to meet customer load, maintain
3 overall situational awareness of our transmission system, and enable the
4 fulfillment of the responsibilities of a Balancing Authority and Transmission
5 Operator.

6 The EMS upgrade project went into service in January 2019 mitigating a
7 significant obsolescence risk with the prior EMS installation. Vendor support for
8 the prior EMS application software entered a legacy support phase in 2015, with
9 no further product patches or defect fixes provided under the annual maintenance
10 and support contract. The scope of the project included upgrading the EMS
11 hardware, operating system, and application software to levels that are currently
12 under vendor support and installing the upgraded system in the new Data Centers
13 (described earlier in this testimony) to improve overall disaster recovery
14 capabilities. The technology improvements embedded in the new software will
15 also increase operator effectiveness through improved situational awareness.

16 The Fourth Exhibit to the Prefiled Direct Testimony of Margaret F. Hopkins,
17 Exh. MFH-5, contains the CSA for this project.

18 **Q. Describe the alternatives evaluated and how this solution was chosen.**

19 A. Two alternatives, including the selected alternative, were evaluated and are
20 discussed below. In evaluating the alternatives, PSE prioritized the following key
21 decision components: (i) obsolescence risks; (ii) cost, including that of retraining
22 personnel; and (iii) the DCDR program schedule.

1 1) Upgrade the existing EMS software to the most current production
2 version – The obsolescence risks associated with the prior EMS
3 installation coupled with the DCDR program schedule to move all systems
4 into the new Data Centers by December 2018 required the most expedient
5 possible schedule for the EMS upgrade. Therefore, PSE elected to remain
6 with our current vendor and upgrade the existing EMS software rather
7 than selecting and implementing an entirely new EMS platform. This
8 alternative was selected as it best met all three of the above-stated criteria,
9 providing the lowest cost/lowest risk solution. Upgrading the existing
10 EMS platform allowed us to optimize and leverage an existing technology
11 platform and avoid the significant cost and schedule impacts associated
12 with switching to an entirely new vendor and platform.

13 2) Select an entirely new EMS suite from a different vendor – This
14 alternative was not selected because it introduced higher costs and
15 significant risks to project schedule and success. It did not meet the
16 timeline required for the Data Center program and drove costs higher due
17 to the extensive re-training required for the user community and IT
18 personnel on a new platform/product.

19 **Q. What benefits does this project and the selected alternative provide for**
20 **customers?**

21 A. This project increases the reliability of monitoring and controlling PSE’s entire
22 electric power system by reducing the risk of EMS failures due to obsolescence

1 and improving disaster recovery capabilities. The selected alternative and
2 emphasis on expediency also reduced project costs and duration, as noted below.

3 **Q. Is the new EMS system in service?**

4 A. Yes. The upgraded EMS went live on January 29, 2019. This was followed by a
5 100-hour period to observe system stability, which ended successfully on
6 February 2, 2019. System fitness-for-use was observed for roughly two more
7 weeks, and the upgraded EMS was declared stable on February 15, 2019.

8 **Q. What was the cost of the EMS upgrade project and how did it compare to the**
9 **estimated cost?**

10 A. Original costs were estimated at \$12.4 million. We expect the project to close
11 approximately \$3.0 million under plan. Budget reductions are primarily related to
12 prudent cost management and key technology decisions that reduced project
13 complexity.

14 **Q. Did the team keep management informed during the course of the project?**

15 A. Yes, the project governance structure aligned with the standard for all PSE
16 technology projects and included involvement by an executive steering committee
17 and a project-level steering committee made up of leaders across the company and
18 from our product vendor and system integrator. Together, these teams participated
19 in project oversight, key decision making, risk mitigations, and approval of costs
20 and changes.

1 **Q. Were there any material changes that affected the project scope, schedule or**
2 **budget?**

3 A. There were no major changes to scope or schedule. The overall project was
4 delivered significantly under budget, as explained above.

5 **B. Human Resources Technology Transformation**

6 **Q. Please describe PSE's Human Resources Technology Transformation ("HR-**
7 **TOPS") project.**

8 A. The HR-TOPS program is a three-year effort that replaces PSE's legacy human
9 resources systems in an effort to:

- 10 • Improve PSE's ability to attract and hire qualified candidates;
- 11 • Create and automate critical reports to reduce the significant manual effort
12 currently required;
- 13 • Implement self-service functionality and mobile capabilities necessary for
14 managers and employees to perform their jobs;
- 15 • Integrate disparate systems to provide a more streamlined service offering
16 and to maintain data integrity between systems; and
- 17 • Modernize the underlying SAP modules scheduled to become obsolete
18 within the next few years, at which point we will no longer receive
19 support, maintenance, or system patches for known security
20 vulnerabilities.

1 The Fifth Exhibit to the Prefiled Direct Testimony of Margaret F. Hopkins,
2 Exh. MFH-6, contains the CSA for HR-TOPS.

3 **Q. Describe the alternatives evaluated and how this solution was chosen.**

4 A. PSE considered three industry leading alternatives which were evaluated against
5 established criteria and are discussed below. In evaluating the alternatives, PSE
6 prioritized the following key decision components: (i) all services will be
7 performed on a single platform consisting of recruiting, onboarding, human
8 resources, compensation, and talent management processes; (ii) in-scope
9 functions and work activities are easy to use, including mobile functionality; (iii)
10 improved analytics to inform operational and strategic decision making; (iv)
11 alignment with IT Technology Principles and low Total Cost of Ownership; (v)
12 and potential to support future functionality such as payroll, timekeeping, and
13 Learning Management in single product suite.

14 1) Cornerstone HR Suite (“Cornerstone”) – This option was not selected
15 because it did not meet the minimum criteria in several areas including
16 coverage of entire project scope. Specific areas where Cornerstone fell
17 short include (a) the product suite did not offer an end-to-end solution
18 covering entire scope and requirements, and did not meet criteria (i); (b)
19 the human resources and recruiting tools were significantly less mature
20 than competitors, giving it lower scores on criteria (ii); and (c) while
21 Cornerstone is the existing legacy Learning Management System, the

1 product did not offer payroll or timekeeping solutions, hence a lower score
2 on criteria (v).

3 2) Workday HCM (“Workday”) – Workday offered a compelling product
4 suite, meeting many of the established criteria including (i), (iii), and most
5 of (ii). However, it fell short because (a) its mobile functionality, part of
6 criteria (ii), required a different mobile device management tool than was
7 currently implemented at PSE, increasing cost and complexity of the
8 mobile solution; (b) integration with existing technologies was more
9 complex, making both implementation costs and ongoing maintenance
10 costs higher than the selected alternative, hence a lower score on criteria
11 (iv); and (c) payroll, timekeeping, and Learning Management functionality
12 was less mature or missing from the Workday product suite, hence a lower
13 score on criteria (v).

14 3) SAP SuccessFactors (“SAP SF”) – After an extensive review of the
15 features and functions offered by each alternative, including a total cost of
16 ownership analysis, SAP SF was selected. SAP SF met all of the required
17 criteria, and in many cases exceeded the others in individual categories. In
18 addition, SAP SF is rated in the top quadrant for human resource product
19 suites, and is widely used in the utility industry, particularly by utilities
20 with an existing SAP presence, as it helps to achieve the highest degree of
21 integration with existing systems.

1 **Q. What benefits does this project and the selected alternative provide for**
2 **customers?**

3 A. HR-TOPS will significantly enhance our existing human resource capabilities,
4 simplify all people related processes, and ultimately improve the user experience.
5 It will increase productivity for managers and employees by reducing errors and
6 manual work-arounds and provide actionable data and metrics to ensure
7 compliance and mitigate risks. HR-TOPS will also drive changes in PSE's hiring
8 process to better enable the identification and development of the talent needed to
9 improve organizational strength and achieve business goals.

10 **Q. Are the new HR-TOPS systems in place?**

11 A. HR-TOPS will be deployed using a phased approach. Phase one includes
12 recruiting, onboarding, and core human resource functions, and it will be placed
13 in service in June 2019. Phase two will go into service in early 2020 and includes
14 compensation, performance and goals management, career development planning
15 and succession, labor relations and workforce planning and analytics.

16 **Q. What is the cost of the HR-TOPS program?**

17 A. The overall program spending is estimated at \$14.3 million. Total cost of phase
18 one is estimated at \$10.3 million. This consists of \$5.3 million spent in 2018, and
19 an additional \$5 million required to complete phase one activities by the in-
20 service date of June 28, 2019. Phase two will go live in 2020 and is estimated at
21 \$4 million, made up of \$3.5 million in 2019 spend and \$0.5 million in 2020.

1 Overall projected program spending remains in alignment with the approved
2 project budget.

3 **Q. Did the project team keep management informed during the course of the**
4 **project?**

5 A. Yes. The HR-TOPS program governance structure aligned with the standard
6 structure for PSE technology projects and includes involvement by an executive
7 steering committee and a project-level steering committee made up of leaders
8 across Business and IT. Together, these teams participate in program oversight,
9 key decision making, risk mitigations, and approval of costs and changes.

10 **Q. Were there any material changes that affected the project scope, schedule or**
11 **budget?**

12 A. To date there have been no major changes to scope, schedule or budget after
13 initial approval of the project.

14 **V. ONGOING INFORMATION TECHNOLOGY EXPENDITURES**

15 **Q. Describe PSE's strategic focus regarding IT expenditures going forward.**

16 A. PSE's recent investments in technology, as outlined in this testimony, represent
17 an ongoing shift due to the digitalization of our industry and are critical in the
18 evolution of what PSE needs to operate reliably, efficiently and securely, and to
19 meet both present and future changing customer expectations. Over the next few
20 years, PSE will continue to invest in necessary technology to meet these
21 requirements. Through these strategic investments, PSE will build upon its

1 existing technology foundation and platforms to enable and support a cost-
2 effective transition toward a digital utility.

3 **Q. Please describe PSE's plans for IT investments with an in-service date during**
4 **the period July 1, 2019 through the end of the rate year (April 30, 2021).**

5 A. PSE's future technology investments are largely a continuation of the investments
6 described previously in my testimony and can be broken down into four
7 categories, with an estimated overall spend of \$211.4 million for IT investments
8 going into service during the rate year.

9 1) Customer Experience – This category represents approximately \$112
10 million of technology investments that directly support PSE's efforts to
11 adapt and meet changing customer expectations in the digital environment,
12 as noted in the JD Power and Market Strategies International studies,
13 detailed in the Prefiled Direct Testimony of Andrew Wappler, Exh. AW-
14 1T. GTZ is the only initiative slated for this category of work. This work
15 will include the delivery of various IWM applications; project initiation,
16 planning, design and execution for electric customer facing work,
17 including Electric First Response and System Ops integration; providing
18 remote functionality to the AMI meters; and the implementation of new
19 payment options and processes for customers.

20 2) Grid Modernization and Reliability – This category represents \$12.5
21 million in IT investment. Grid modernization and reliability technology
22 investments directly support the objectives detailed in the Prefiled Direct

1 Testimony of Catherine A. Koch, Exh. CAK-1T. The largest technology
2 initiative associated with this category of work is related to improvements
3 to the IT systems supporting our Energy Imbalance Market, with an
4 anticipated investment of \$4 million.

5 3) Corporate, Compliance, and Risk – PSE plans to invest \$29.7 million in
6 corporate systems technology investments that create a secure, productive,
7 and stable operating environment. The initiatives in this program mitigate
8 risk and drive improvements to enterprise systems to support financial
9 stability, employee productivity, cyber security and business enablement.
10 The largest capital expenditure planned for this program at \$7 million
11 focuses on transforming our procurement systems and mitigating risk
12 (cyber and financial) associated with conducting business with third
13 parties. With approximately 2,500 active vendors who have physical and
14 logical access to PSE properties and systems, it is important that we
15 ensure these third parties are acting in the best interest of PSE and not
16 introducing additional risk. PSE’s current processes and systems are
17 aging, and they pose constraints to timely management of access controls
18 and limit our ability to mitigate risks and challenges related to effective
19 third-party management.

20 4) System Modernization and Optimization – This category represents
21 investment of approximately \$57.2 million. As noted earlier in this
22 testimony, the System Modernization and Optimization program is an
23 ongoing program to maintain key critical technology platforms to ensure

1 their security, availability, and recoverability. Capital expenditures
2 associated with the category can be broken out as follows:

- 3 • Technology Refresh and Growth projects: \$52.2 million of the
4 investment associated with the System Modernization and
5 Optimization category is related to annual technology refresh and
6 growth projects. These projects are funded via an annual program
7 and, as described above, are necessary to maintain service level
8 requirements, receive support from vendors to patch security
9 vulnerabilities, and to continue operational compliance with
10 NERC/CIP obligations. Investment in this category also supports
11 efforts needed to scale core infrastructure in alignment with natural
12 business growth and new business requirements and capabilities.
13 The largest category of investment projected under this category is
14 estimated at \$6 million and is related to the replacement of end-of-
15 life critical hardware required to run financial and customer
16 information systems in our data centers. Other smaller projects will
17 be planned annually, with most completing in the same year as
18 they are initiated.
- 19 • Critical System Upgrades and Enhancements: \$5 million of the
20 investment associated with the System Modernization and
21 Optimization category is related to critical system upgrades and
22 enhancements that are prioritized based on business need and
23 vendor requirements to maintain support.

1 **Q. Are PSE's IT expenditures necessary and reasonable?**

2 A. Yes. As discussed in this testimony, each of the investments described above are
3 required to ensure that PSE acquires and maintains the requisite technological
4 systems and processes so that PSE operates reliably, efficiently and securely. The
5 level of spending that PSE has undertaken in the test year and will continue in the
6 rate year, as described above, is necessary and reasonable. Unlike traditional
7 transmission and distribution investments that typically have much longer
8 depreciable life spans, technology investments have much shorter depreciable life
9 spans that require more frequent updating, upgrading, and replacement, due to the
10 rapidly evolving nature of technology and the digitalization of utility service. PSE
11 has invested, and will continue to invest, appropriately at a level to keep its
12 technology current and to address security threats.

13 **VI. CONCLUSION**

14 **Q. Does this conclude your testimony?**

15 A. Yes, it does.
