	Outcome 1: Ensure utility res	ponsiveness to customer outages and restoration times.	
	Outcome 1: Ensure utility res	ponsiveness to customer outages and restoration times.	SAIDI and SAIFI are not customer-focused metrics. IEEE defines SAIDI and SAIFI to be calculated for an electrical system, not to be calculated geographically or spatially for subsets of an electrical system where a circuit/feeder or multiple circuits/feeders serve that subset of the system, such as for Named Communities. SAIDI and SAIFI are used to form a base understanding of general reliability. Avista is concerned that the metrics as proposed will lose their value when not viewed on a system level, especially since feeders can cross multiple census tracts identified as Named Communities and even state lines, so the metrics would not be completely accurate for Named Communities. For a complete view of each utility's reliability, Avista suggests starting with SAIDI and SAIFI at a system level, excluding MEDs. If there is a desire to view reliability with MEDs included, then that should provided as well. Moving to customer focused reliability metrics, IEEE says CEMI and CELID are the most commonly used customer-focused
1	Equity in Reliability (SAIDI) for Named Communities and Non-named Communities.	Sum all customer interruption minutes, for interruptions greater than 5 minutes, for one year and divide it by the average annual customer count. Provide this calculation for the service territory as a whole and separately for Named Communities.	metrics, which both are included below. Additional metrics
2	Equity in Reliability (SAIFI) for Named Communities and Non-named Communities.	Sum the total number of all customer interruptions, for interruptions greater than 5 minutes, for one year and divide it by the average annual customer count. Provide this calculation for the service territory as a whole and separately for Named Communities.	Same comments as SAIDI.
3	Equity in Reliability: length of power outages	Average and median length (in minutes) of power outages per year, separately calculating Named and Non- named Communities for comparison.	Avista supports this metric as written.
4	Historically Worst Performing Circuits	The 10 worst performing circuits in any given year separately by both frequency and duration. In addition, of the 10 worst performing circuits (separately by frequency and duration), the number of years over the past five years that a circuit has appeared on the list.	Avista supports this metric as written.
Outcome	2: Utilities are prepared for and respond to outages and other impact	s caused by cyber-attacks, significant events, wildfires, storms, extreme weather events, and other natural	Avista Comments
	Wildfire Avoidance Response Time to Natural Gas System Emergencies come 3: Resilient infrastructure and service, including distributed ene	Number of utility-caused wildfires, ignitions (that do not result in wildfires but could have), and risk events (event with probability of ignition). Average and median length (in minutes) from customer call to arrival of field technician in response to natural gas system emergencies. rey resources, to enable customers to maintain essential functions during times of potential outages.	Avista can provide this metric as written but agrees definitions are important for consistency of reporting across Avista can provide this metric as written. We do not suggest adding input metrics at this time. We are open to discussing Avista Comments
	Equity in Resilience Investments	Percent of proposed resilience projects in Named Communities that are completed every year, compared to a proposed projects list that is approved by the Commission.	Avista supports the feedback provided on this metric, particularly the need to define what is included in resilience projects and how the metrics relate to what has been approved or communicated with or by the Commission. The last piece about the approval or communication with or by the Commission may not be needed for this metric due to the timing delay for when resilience projects may be reviewed or approved (i.e. in a CEIP or GRC).
8	Customers Experiencing Multiple Interruptions (CEMI) for Named and Non-named Communities	Average number of outages for customers experiencing multiple interruptions. Total number of customers that experience more than three sustained interruptions divided by the total number of customers served. Provide this calculation for the service territory as a whole and separately for Named Communities.	Avista can provide this metric as written. If a range of values are considered, we suggest limiting the range to 0-3.

total just as we report it today, which is also how we will arrearages by month, by class, measured by zip code - to include 30+, 60+, and 90+ days arrears for total company, and electric and natural gas stated separately for dual fuel utilities. Locationers are eligible to enter an AMP if they are 30+ past due, which is when they begin accumulating arrears. For the responsibility, and CEIP metrics. Customers in Arrearage Management Plans Number of residential customers, by zip code, in arrears with arrearage management plans (AMPs)/Total which is when they begin accumulating arrears.
