Ms. Kimberly Harris, CEO  
PSE

When my children were young my family lived in the shadow of the Pleasant Power Station in Belmont, WV. Though my children were spared, the rate of asthma in the area among children was very high due to that plant's emissions and emissions from other coal-powered industry in the area. At the time it seemed like there was no option but to live with the consequences of a needed plant.

Recently I saw that the rate of deployment of new solar and wind facilities is growing exponentially. This means that the generating capacity of renewables will overtake coal's in the near future. It is time for PSE to deploy renewables rapidly to replace the polluting and backward generating station at Goddard, MT. Please be ready to retire that plant completely in 2025.

Thank you
