Subject: PG-082195 Data Request Regarding “Hand Jeeping”, December 12, 2008

2009 JAN - 2 AM 9:33
STATE OF WASHINGTON
UTILITIES AND TRANSPORTATION
COMMISSION

Dear Mr. Danner:

We have reviewed the subject data request and respond with the following information.

On December 3, we received an email from Lex Vinsel regarding the inspection by Al Jones of the coating on a project on N Street in Wheeler. A copy of that email is attached. Staff was concerned about the coating condition because of “failure to ‘jeep’ the coating.” In our email of December 10, attached, we explained to Staff that the coating was inspected using visual and tactile methods, or hand jeeping, to detect coating damage detrimental to corrosion control.

The project on N Street started on November 4, 2008. The pipe used on the project is from our Purchase Order P12043, which is attached. The pipe coating is manufactured according to CNG Specification No. 11 – Steel Pipe Coated with Polyethylene, attached. One requirement of that specification is that the vendor use an electronic holiday detector over the applied coating to test for manufacturing defects.¹ The pipe was coated on May 5, 2008 and received by Cascade on May 9, 2008. The factory applied coating is extruded polyethylene over mastic.

In the December 12 letter, Staff states an “*opinion that hand jeeping is not recommended as an acceptable industry standard for pipe of this size.*” With the following responses, we answer the question of whether hand jeeping is an acceptable method of inspection under the pipeline safety codes and support our decision to accept hand jeeping for 4” and larger pipe. We welcome the opportunity to meet with Staff and discuss the details of this response.

Our specific responses to the December 12 data requests are as follows:

1. CNG’s analysis for justification for hand jeeping 4-inch and larger diameter pipe including

¹ The code requires inspection at the time of construction. Factory inspections are over and above code.

documentation based on sound engineering principles, such as a professional group as NACE.

In our experience, hand jeeping is an industry accepted method for field inspection of polyethylene sheath coatings. It has been used for many years by operators, and before electronic holiday methods were invented. To our knowledge, it has never been prohibited by any professional or technical organization. Operators vary on their chosen restrictions for this method. The restrictions are often based on pipe segment length or pipe diameters. The acceptability of the method is not dependent on pipe segment length or pipe diameter. These operator choices do not restrict hand jeeping as a method of inspection acceptable under the code.

If electronic holiday detectors are used, they are not capable of being used for all surfaces. The device encircles the pipe and coating, and must pass directly over a section of coating to detect a defect. These devices cannot pass by inline tees, or service taps. Therefore, electronic detectors must be set aside for that portion leaving hand jeeping as the only option to perform a full inspection. As with hand jeeping or any construction technique, the use of electronic holiday detectors is susceptible to missing coating defects if not used diligently. Electronically jeeping large diameter pipe is certainly more time-efficient than visually inspecting the entire surface, but may not guarantee a higher quality result if not performed with appropriate care and attention.

Hand jeeping meets the applicable pipeline safety code for external coating inspections.² All defects "detrimental to effective corrosion control" on polyethylene sheath coating can be detected by hand jeeping. Examples of defects given by Staff are "gaps in wrapped coating and cracks or thin wall thickness in extruded coating." NACE lists "bubble or blister-type voids, cracks, thin spots, and foreign inclusions or contaminants"³ as being detectable by electronic holiday detectors.

All these defects can be detected by the combination of electronic jeeping at the factory and hand jeeping in the field.

Conservatively, significant defects are visible or can be felt, but some smaller ones may not be so easily spotted. These small or invisible defects are not detrimental to corrosion control because the coating inspection is not the sole corrosion control method for buried pipe. The additional control is the application of cathodic protection. The purpose of "external coatings is to control corrosion by isolating the external surface of the underground piping from the environment, to reduce cathodic protection current requirements and improve current distribution for the cathodic protection system."⁴ The fact that some minor defects may not be detected is acceptable because cathodic protection is applied to protect breaks or weaknesses in the external coating. The effect of more holidays is an increase in cathodic protection current requirements and a reduced current distribution for the cathodic protection system. Both of those issues are adequately addressed by

² PHMSA 49 CFR Part 192.461(c) – *Each external protective coating must be inspected just prior to lowering into the ditch and backfilling, and any damage detrimental to effective corrosion control must be repaired*".

³ NACE Standard Practice SP0274-2004 Section 1.1

⁴ NACE Standard Practice SP0169-2007 Sect. 5.1.1 – *The function of external coatings is to control corrosion by isolating the external surface of the underground or submerged piping from the environment, to reduce CP current requirements, and to improve current distribution.*

the application of cathodic protection within one year of completion of construction⁵, performance of monitoring required by pipeline safety codes⁶, and adjustment of the cathodic protection system as needed to provide adequate corrosion control. In most cases, cathodic protection is applied to new steel pipe within Cascade's systems immediately upon completion by tying into existing protected systems. In any case, a defect in the polyethylene sheath coating would have to be significant to defeat the cathodic protection system. And, if a defect is significant it can be found by hand jeeping.

To check the actual results of hand jeeping, we reviewed our leak records for the past 10 years to look for any correlation between construction defects and corrosion leaks. In that time we have had 115 leaks on steel mains 2" and larger. 99 of these leaks were on pipe installed before 1961. 2 of the leaks had no construction record available, but can be deduced as being installed before 1971. 14 of the leaks were on pipe installed during the period 1961 to 1971. The coating types were coal tar wrap or polyethylene sheath. The driving factor for this data appears time dependent; primarily older coatings, and corrosion that may have occurred before cathodic protection was applied.⁷ Unrepaired construction defects detrimental to corrosion control would display a spread of corrosion failures spanning past 1971 construction dates. We've been using hand jeeping on 2" pipe since 1961. The results indicate the cathodic protection system is controlling corrosion on our piping systems that were hand jeeped. We conclude that hand jeeping on 2" and larger pipe has proven capable of finding and repairing defects detrimental to corrosion control.

The applicable NACE recommended practices are not incorporated by reference into the pipeline safety codes.⁸ We concur that they are useful guides and advice, but they are not mandatory. NACE design their recommended practices in full knowledge that specific practices must be picked by pipeline operators, and that alternative practices may exist or yet be invented. NACE does have documents that recommend the use of electronic holiday detectors for coating inspections, but NACE does not specify that method as the only acceptable method.⁹ NACE also says "Use of a holiday detector should be at the discretion of the coating inspector."¹⁰ NACE is silent about the use of hand jeeping. That by no means prohibits its use as an inspection method. To our knowledge, there are no professional organizations that recommend hand jeeping be prohibited.

Hand jeeping is a method for inspecting polyethylene sheath coatings that meets 49 CFR Part 192.461(c). Hand jeeping is a traditional and widely used method of pipeline coating inspection. The decision when and where to use electronic jeeping or hand jeeping is a choice that varies

⁵ PHMSA 49 CFR Part 192.455(2) External corrosion control: Buried or submerged pipelines installed after July 31, 1971. – *It must have a cathodic protection system designed to protect the pipeline in accordance with this subpart, installed and placed in operation within 1 year after completion of construction.*

⁶ PHMSA 49 CFR Part 192.465 External corrosion control: Monitoring, WAC 480-93-110 Corrosion Control

⁷ 49 CFR Part 192.457 was enacted in 1971. All of our piping had cathodic protection applied in this timeframe.

⁸ NACE Standard Practices SP0169-2007, SP0274-2004, and SP0185-2007

⁹ NACE Standard Practice SP0169-2007 Sect. 5.2.2.3 –*The use of holiday detectors is recommended to detect coating flaws that would not be observed visually.*

¹⁰ NACE Standard Practice SP0274-2004 Section 1.2

between operators. This method is effective for any diameter of pipe. Hand jeeping is not prohibited by any known technical or professional organization. Hand jeeping is not prohibited by pipeline safety codes. Hand jeeping can detect and prevent defects that might be detrimental to corrosion control. Hand jeeping can be used to inspect pipe configurations that electronic detectors cannot. On these grounds, it is reasonable for Cascade to use the hand jeeping inspection method.

2. How long has hand jeeping been used in lieu of electronic jeeping?

We have no record of that, but most likely for over fifty years. The PHMSA 49 CFR Part 192.461 was enacted in 1971. The NACE recommended practice for electronic jeeping was first published in 1974. It could be said that we have used hand jeeping instead of electronic jeeping since 1974. We have definitely used hand jeeping on 2" going back that far, and as stated before, we have not seen any sign that defects detrimental to corrosion control have been the result. We believe that both electronic jeeping and hand jeeping meet Part 192.461, so interchanging them was not something that we tracked.

Our historical practice is to require contractors to electronically jeep coatings on individually bid projects. This practice provides us an additional level of inspection on projects constructed using personnel that are less familiar to us. Project supervisors have been given freedom in the method we let qualified direct employees use. None of this prohibits hand jeeping from being an acceptable method that meets the code.

3. Operator qualification records including a copy of the covered task describing the process for hand jeeping, task qualification methods, list of individuals qualified to perform this covered task and dates of qualifications.

A copy of the covered task description entitled "Cold Applied Tape" that covers external coating inspection is attached.

A list of all employees qualified to perform the covered task and their dates of qualifications is attached. The names of the primary employees working on the N Street project in Wheeler are: Steven Knutson, Jason Moody, and Mickey West.

4. What pipeline projects, during the past ten years, were hand jeeped in lieu of electronic jeeping within Washington? Please include:

- a. Date of construction,
- b. Project location,
- c. Pipe size,
- d. Type of coating, and
- e. Length of pipe.

We have no records showing which inspection method was used on any particular project. Based on our historical practice, the two methods were interchangeable for construction performed by Cascade employees. A list of all steel pipe projects 4" diameter and larger is attached, based on current property asset records. The property records do not specify the coating. Reviewing our purchasing records found that Cascade has exclusively purchased extruded polyethylene coating sheaths over pipeline sealant material from 1998 to today¹¹. Since we generally employ contractors on high pressure pipeline projects and projects larger than 4" diameter pipe, the most relevant projects for Staff consideration would be 4" mains.

If you have any questions please contact Keith Meissner at 206-381-6734.

Sincerely,
CASCADE NATURAL GAS CORPORATION

¹¹ CNG Specification No. 11 – Steel Pipe Coated with Polyethylene

From: Vinsel, Lex (UTC)
To: Hicks, Sam
Cc: Jones, Al (UTC) ; Lykken, David (UTC) ; Zuehlke, Stephanie (UTC)
Sent: Wed Dec 03 11:28:26 2008
Subject: Wheeler WA - CNG crew NOT jeeping 4 inch coated steel pipe before placing in trench.

Hello Sam Hicks,

On December 2, 2008 UTC staff (Al Jones) performed a random crew inspection on a Cascade Natural Gas (CNG) crew located on N St in Wheeler WA.

Staff found the crew placing a 4" (4 inch) coated steel pipe in a trench and backfilling WITHOUT 'jeeping' the pipe to detect any 'holidays' in the coating. When asked, the crew replied that visual or hand inspection was all that was required for 4" coated steel pipe. According to CNG's procedure 605.0491(a) Cascade's standard practice is to "jeep" pipeline construction of 4" pipe or larger to detect holidays in the pipe coating.

When the procedure was brought to CNG's attention, they admitted they missed it.

Please respond within 10 business days on how CNG plans to mitigate this failure to 'jeep' the coating on this 4" coated steel pipe prior to placing it in the trench as required.

Staff is concerned about the coating condition of this coated pipe because it was welded up early in 2008, and has spent the summer exposed to the elements.

If you have any problems or questions please contact Al Jones (360) 664-1321 or me.

Sincerely

Lex Vinsel

Pipeline Safety Inspector

Subject: RE: Wheeler WA - CNG crew NOT jeeping 4 inch coated steel pipe before placing in trench.

Lex:

We interviewed our employees and supervisors that have installed this main, and reviewed our CP 605.0491.

Our employees employed visual and tactile inspection of all the coating on this main. Visual and tactile inspections are an industry accepted method of inspecting coatings. No additional inspections are necessary to ensure that the coating is acceptable.

Cascade has employed visual and tactile inspection of pipe coatings as the most common method of pipe coating inspection for 2-inch, 4-inch and, often, 6-inch welded steel pipe for many years. We have found this method effective in identifying coating defects and have not experienced coating or pipe failures as a result.

Our procedure 605.0491 does specify that electronic jeeping be employed for 4" pipe and larger. This procedure has existing in this form for many years, but should have been updated to also include visual and tactile inspection. We will update our procedure to include visual and tactile inspection as an acceptable method to reflect our current practice.

If you have any further questions or concerns, please contact me.

Keith Meissner

Manager, Safety & Compliance

CNG SPECIFICATION NO. 11
STEEL PIPE COATED WITH POLYETHYLENE

COLOR - Yellow

SHEATH MATERIAL

GENERAL COMPONENTS: Inhibitive pigment (primer only)
Inert and reinforcing pigments
Color pigment
Primary resin
Secondary resins
Solvents
Plasticizers

CUT BACK OF COATING:		6" From end of Joint (beveled edge.)	
MINIMUM THICKNESS AND JEEP SETTINGS	<u>PIPE SIZE</u>	<u>THICKNESS</u>	<u>JEEPED @</u>
	3/4", 1 1/4"	23 Mills	7,200 VDC
	2"	27 Mills	7,800 VDC
	4"	32 Mills	8,500 VDC
	Greater than 4"	36 Mills	9,000 VDC

TEMPERATURE RANGE - -40 to 165 Degrees F

TENSILE STRENGTH - 3000 psi Minimum

SHEATH MATERIAL - Polyethylene

MARKINGS - The following markings in the following order are required on all coated steel pipe except as noted:

1. Cascade Pipe Purchase Order Number
2. Name of Coating Manufacturer
3. Spec 5L
4. Nominal Diameter
5. Weight per Foot (for sizes 4 1/2" O.D and larger)
6. Grade and Class
7. Process of Manufacture
8. Heat Treatment (if specified in P.O.)
9. Test Pressure (if specified in P.O.)
10. Date that Coating is applied

For specific codes refer to API 5L Section 11 - Marking and Coating

In addition, the coating must be resistant to stress cracking, water penetration, moisture absorption, weathering, dielectric strength-break-down, fire, and other conditions consistent with use on a natural gas piping system.

The coating shall have moisture vapor transfer resistance, good to excellent resistance to alkali, acid, water and weather.

Title: Cold Applied Tape
Regulations: Codes DOT49 CFR-192.627
Cascade CP's: 605 & 645
Subject Matter Expert: Director - Field Operations
Qualification Interval: Written - 3 years, Performance – 3 years
Span of Control 3:1
Date Completed: Written: _____

Performance: _____

Knowledge Required

- Understand procedure for proper pipe preparation prior to wrapping.
- Understand proper techniques for primer application.
- Understand when to use Royston Greenline Tape and/or Polyken Tape.
- Understand proper techniques for cold applied tape application.
- Identify an improper tape application verses a proper one.
- Identify and respond to AOC's associated when wrapping pipe.

Skills Required

- Ability to properly prepare pipe surface prior to tape application.
- Ability to identify proper consistency of primer and correct, if necessary.
- Ability to properly apply primer, if required.
- Ability to make a proper tape application on all sized pipe.

Abnormal Operating Conditions	Remedial Action*
Imbedded material in coating.	Remove defective material and repair (wrap), "if qualified", or refer to General Manager.
Torn or ripped coating.	Remove defective material and repair (wrap), "if qualified", or refer to General Manager.
Disbonded wrap or coating.	Remove defective material and repair (wrap), "if qualified", or refer to General Manager.
Improper backfill (asphalt, rock, etc.) around pipe.	Take corrective action, "if qualified" or refer to General Manager.

Note: All AOC's should be documented. The General Manager should be notified if repairs were completed or need to be scheduled.

Training

- On-Line Training Module ***1280DOT Cold Applied Tape*** with written exam.
- Review **CP 605** and **CP 645**.

Evaluations Methods

- Ensure student is currently qualified on the On-Line Training Module ***1280DOT Cold Applied Tape***.
- Administer the 1280DOT Performance Evaluation.
 - Provide a printout of Task Sheet to student.
 - Review and discuss Task Sheet information and AOC's.
 - Observe student completing the requirements of the printed Performance Evaluation form.
