responsionity area to plan for long-term neughig requirements. Mr. Markell is (		responsibility area to plan for long-term hedging requirements. Mr. Markell is the

Senior Vice President Energy Resources for PSE.

#### 2 Q. Please summarize the contents of your testimony.

1

10

A. I first provide some brief background information regarding the Power Cost
Adjustment ("PCA") Mechanism and how it addresses the volatility of PSE's
power costs. I then describe new resources and efforts undertaken by PSE to
manage, control and moderate its power costs during the six-month period that
began on July 1, 2006 and ended on December 31, 2006 ("PCA Period 5"). Finally,
I compare the Company's actual power costs for PCA Period 5 to its baseline power
cost rate.

#### II. BACKGROUND REGARDING THE PCA MECHANISM

#### 11 Q. Why does the Company have a PCA Mechanism?

12 A. The parties to the Company's 2001 general rate case were keenly aware from the 13 experience of the Western Power Crisis in 2000-01 how volatile power prices can 14 be. In response to that potential volatility, uncertainty in the wholesale energy 15 markets and PSE's need to add resources to meet its load obligations, the parties 16 who participated in the Power Cost Adjustment Collaborative in the 2000-01 17 general rate case agreed to a negotiated Power Cost Adjustment ("PCA") 18 Mechanism. The Commission approved the PCA Mechanism in its Twelfth 19 Supplemental Order in Docket Nos. UE-011570 and UG-011571.

1

Q.

#### Please describe why PSE's power costs can be volatile.

2 A. PSE's power supply portfolio contains a diverse mix of resources with widely 3 differing operating and cost characteristics. Although there are many complex 4 variables embedded in the portfolio, the major volume and price drivers of power 5 cost volatility are: (1) streamflow variation affecting the supply of hydroelectric 6 generation; (2) risk of forced outages of generating units; (3) weather uncertainty 7 affecting power usage; (4) variations in market conditions such as wholesale gas 8 and electric prices; and (5) transmission and transportation constraints. All of these 9 have an impact on load and resource volatility, which PSE balances with wholesale 10 market purchases and sales.

#### 11 Q. How does the PCA Mechanism work?

A. Generally, the PCA Mechanism sets forth an annual accounting process for a
sharing of costs and benefits between PSE and its customers over four graduated
levels (so-called "bands") of power cost variances for the first \$120 million of
power cost variances. On power cost variances over \$120 million, the PCA sharing
mechanism allocates 95% of costs or benefits to customers and the remaining 5% of
costs or benefits to PSE.

#### 18 Q. What do you mean by "power cost variances"?

A. Power cost variances are the difference between: (i) the "baseline" fixed and
variable power costs that are built into PSE's electric rates and (ii) the variable

1		power costs that PSE actually incurs, plus the fixed power costs as determined in

#### III. PCA PERIOD 5 POWER COSTS

#### A. <u>New Resources During PCA Period 5</u>

## Q. Is the Company seeking inclusion of any new long-term electric supply resources in the PCA Period 5 power costs?

5 A. No. The Company sought recovery of and received a prudence determination on 6 several resource items in PSE's 2006 general rate case proceeding, Docket No. UE-7 060266 and UG-060267 (the "2006 GRC"). These included the Wild Horse wind 8 project, the 20-year purchased power agreement between PSE and OrSumas, LLC, 9 the relicensing of the Baker River Hydroelectric Project, and the 20-year purchased 10 power agreement and related transmission agreement between PSE and Public 11 Utility District No. 1 of Chelan County, Washington (including recovery of interest 12 at the net of tax rate of return). In addition, PSE recently acquired the Goldendale 13 Generating Station, a 277 MW natural gas-fired plant in Goldendale, Washington, 14 and has filed a Power Cost Only Rate Case, Docket No. UE-070565, in which it 15 seeks recovery of and a prudence determination on the Goldendale Generating 16 Station, including its associated capital costs, operating costs, transmission costs, 17 and costs for natural gas pipeline capacity.

2

Prefiled Direct Testimony (Confidential) of David E. Mills

## Q. Did PSE acquire any new resources during PCA Period 5 with a term of less than or equal to two years?

3 A. Yes. PSE acquired such resources in connection with short- and intermediate-term 4 off-system physical or financial purchases and sales of power and/or fuel to 5 generate power. The majority of such transactions during this period were short-6 term balancing transactions of power and natural gas for power purchases and sale 7 contracts. Such balancing transactions are made in response to changes in market 8 heat rates, which guide decisions whether to hedge power versus natural gas for 9 power, and changes in load or resource availability. Such transactions include intermediate term transactions entered into pursuant to PSE's programmatic 10 11 portfolio hedging efforts.

The Company purchased winter capacity and entered into one power exchange to improve the reliability of supply to PSE's system. In addition, the Company acquired additional BPA transmission rights for the winter 2006-07, which was approved in the 2006 GRC.

#### 16 Q. Why did PSE enter into the various transactions described above?

A. These transactions were undertaken within a comprehensive portfolio and risk
management system of organizational structure, technological tools, and human
resources designed to allow PSE to: (1) deliver reliable energy when our customers
demand it; (2) serve our customers while mitigating price volatility; and
(3) enhance the value of PSE's energy resources.

1

1		The Company has organizational structures in place to provide upper level
2		oversight and policy direction and decisions while also permitting Energy Portfolio
3		Management Department staff the flexibility to implement PSE's policies and
4		manage the portfolio on a day to day basis. The Company has also developed
5		systems and tools to aid its personnel in performing their portfolio management
6		duties. The Company is continually looking for ways to improve its existing
7		systems and tools to further enhance its risk management capabilities.
8		The following section of my testimony first provides a description of these systems
9		and tools. I then illustrate their application for PCA Period 5 by describing actual
10		hedging strategy decisions and their execution undertaken by PSE with respect to
11		its power supply for July 2006.

PSE's Energy Portfolio Management Department ("EPM Department") – composed of energy market analysts, quantitative analysts, and other professionals – is responsible for identifying, quantifying, and reporting on risk factors. The EPM

1 Company. The EPM Department includes the Power and Gas Supply Operations Departments ("PGSO"), which perform these tasks and manage PSE's short-term 2 3 portfolios. 4 PSE's Energy Management Committee ("EMC") – composed of senior PSE 5 officers - oversees the activities performed by the EPM Department and PGSO staff. The EMC provides policy-level and strategic direction on a regular basis. In 6 7 addition, the EMC reviews monthly position reports, sets risk exposure limits, 8 approves policy and procedures, reviews proposed risk management strategies, and 9 approves the appropriate strategies for implementation by staff. 10 With respect to hedging strategies for specific time periods or quantities of energy, the EMC has approved a programmatic hedging plan. EPM staff follows this plan 11 to systematically reduce the Company's net power portfolio exposure beginning 12 13 months in advance of the month in which the power will be needed to serve PSE's 14 load. This process is described in greater detail below. Such exposure reduction is 15 subject to minimum and maximum monthly limits to reduce timing and market 16 risks associated with hedging activities. EPM staff may also recommend hedging or more months out that departs from this plan, but execution of such hedges is 17 18 subject to EMC approval. 19 Bv ahead of delivery, the bulk of the hedging strategies and transactions 20 have been made. Decisions about hedges for delivery months or less after ", also referred to as " 21 execution (" ") are made Prefiled Direct Testimony Exhibit No. (DEM-1CT) REDACTED (Confidential) of Page 8 of 23 VERSION David E. Mills

1		by EPM staff, within limits set out in PSE's Energy Supply Hedging and
2		Optimization Procedures Manual ("Procedures Manual").
	6	
3	Q.	How does PSE integrate hedging activities into its provision of electric power
4		to customers?
5	A.	PSE employs production cost modeling techniques to estimate future demand for
6		on-peak power, off-peak power, and natural gas for PSE's fleet of gas-fired power
7		plants through its KW3000 risk system. The KW3000 risk system permits PSE to
8		model scenarios of price, hydro, load, generating resources and other inputs as
9		required to represent future projected portfolio needs.
10	Q.	Please further describe what the KW3000 risk system does.
11	A.	In order to model a variety of scenarios regarding PSE's gas-fired generation,
12		KW3000 takes into account each plant's individual operating characteristics,
12 13		KW3000 takes into account each plant's individual operating characteristics, including: conversion efficiency, start-up costs, variable operating costs, ramp rates,
13		including: conversion efficiency, start-up costs, variable operating costs, ramp rates,
13 14		including: conversion efficiency, start-up costs, variable operating costs, ramp rates, minimum run times, planned outages, and unit availability. KW3000 performs
13 14 15		including: conversion efficiency, start-up costs, variable operating costs, ramp rates, minimum run times, planned outages, and unit availability. KW3000 performs simulations of different market conditions and random outages in order to develop

Prefiled Direct Testimony (Confidential) of David E. Mills

1		KW3000 incorporates the inter-relationship between gas and power prices in
2		developing its probabilistic gas and power positions. In different market scenarios,
3		PSE would have different gas or power requirements. The reason for this is
4		twofold. First, the plants have different heat rates and become economic to
5		dispatch at different price differentials between power and gas. Second, the
6		forward market prices for power and gas are volatile, and the price relationship
7		between power and gas, the "implied market heat rate," changes as well. At certain
8		implied market heat rates, PSE will expect to run each plant at an expected rate, and
9		the total of all the plant requirements can be calculated. But if market conditions
10		change, then PSE will expect to adjust its gas and power purchases and sales, in
11		order to serve load with the most economic resource. For example, it may be more
12		economic to purchase power than to purchase gas to generate the power PSE needs
13		to serve its load. KW3000 also incorporates the hedges that PSE has already
14		executed as part of PSE's resource stack.
15	Q.	How does PSE use KW3000 to help make hedging decisions?

16 A. KW3000 generates a volumetric position report for gas for power, on-peak power, 17 and off-peak power. The position report shows, for each of the months 18 following the date of the report, the resource types in PSE's power position grouped 19 by Short-term Purchase and Sale transactions, Long-term contracts, Frederickson 1 20 (Fred 1), Tenaska and Encogen, Combustion Turbines (CT's), NUGs/QFs, Coal Plants, and Hydro (both PSE owned and Mid-Columbia ("MidC") Contracts). The 21 22 gas-fired generation is therefore categorized by heat rate efficiency of the facilities.

1		Tenaska and Encogen have very similar heat rates, and are grouped together.
2		Fredonia, Fredrickson, and Whitehorn CT's are grouped together because of their
3		similar heat rate conversions. Frederickson 1 is separate from the others because of
4		its lower heat rate.
5		Based on this volumetric position for each month, KW3000 also generates a report
6		showing the potential exposure associated with the "open" positions (defined as any
7		net surplus or deficit amount). See Exhibit No. (DEM-4C).
8		Once PSE's aggregated energy position and net exposure are defined for a
9		particular period, the risk management staff evaluates and develops risk
10		management strategy proposals and/or executes transactions around the purchase or
11		sale of gas or power, as appropriate to balance the position and reduce the exposure.
12		Execution entails entering into specific transactions with approved counterparties,
13		using both approved instruments and executed master agreements.
14	Q.	How does PSE's staff develop a view of appropriate hedging strategies for the
15		power portfolio?
16	A.	The EPM Department utilizes a wide set of tools and sources of information to help
17		them make informed decisions about dispatching plants, purchasing fuel, executing
18		hedges approved by the EMC and optimizing excess capacity in the power
19		portfolio. They also hold weekly strategy meetings so that the combined teams can
20		review operational events, discuss market trends, and review supply/demand
21		information. With this context, they work together to understand the greatest
	(Conf	ed Direct Testimony Exhibit No. (DEM-1CT) idential) of Page 11 of 23 E. Mills

1		exposures in the portfolio, and discuss where hedging priorities occur.
2		The EPM Department collects a wide range of data to monitor supply/demand
3		factors which include but are not limited to: weather trends; macro economic
4		factors; crude oil complex; gas storage inventories across the U.S., Canada and in
5		the western U.S.; hydro run-off forecasts; reservoir storage; precipitation and
6		snowpack. Additionally PSE staff review other energy companies' forecasts of
7		price and supply/demand fundamentals, such as trading firm newsletters and
8		consulting service forecasts.
9		EPM staff also receive real-time information from a variety of sources which
10		include information feeds as well as email newsletters from industry sources such
11		as: McGraw Hill (Gas Daily, Megawatt Daily), Future Source, Genscape,
12		Intercontinental Exchange (live price data), and broker lines that act as PA systems
13		where current transactions are communicated though a speaker system. EPM staff
14		has live data coming from the systems operations staff so they can view real-time
15		load data and real-time generation dispatch.
16	Q.	Does the Company use any other tools to manage its energy portfolio?
17	A.	Yes. The Company also uses an on-line counterparty credit risk management
18		system to assist the Credit department and the EPM staff in evaluating potential

transactions with respect to credit issues. With this tool, the reader can review data

including: Moody's and S&P rating of the entity; applicable information about the

parent of the entity; amount of parental guarantee credit provided to PSE if

20

19

1		applicable; the entity's amounts payable and receivable; the aggregate mark to
2		market exposure of all open forward transactions with the entity (the dollar value of
3		the difference between the original contract price and current market price); the
4		credit line assigned to the entity, the existence of netting terms; and FAS 149
5		designation for accounting purposes. This information is calculated daily.
6		Furthermore, PSE traders can model what impact an incremental trade could have
7		with a specific counterparty. The counterparty credit risk management system
8		models the impact on the credit exposure of the Company and the counterparty of
9		the incremental trade itself, as well as the impact that would result if the market
10		moved significantly away from the price at which the deal was struck. If a
11		significant market movement would cause the credit exposure to exceed the amount
12		allowed with that counterparty, the system would indicate that the trade should not
13		be performed with that counterparty. In that case, the trader would find a different
14		counterparty to complete the transaction.
15	Q.	What guidance does the Company have in place for approaching risk
16	Q٠	management strategy proposals?
10		management strategy proposals.
17	A.	Over the past several years, PSE moved from a more "discretionary" model of
18		making hedging decisions to a more "programmatic" approach to hedging. The
19		dollar-cost averaging strategy established a disciplined approach to purchasing a
20		defined volume of gas or power on a monthly basis. In applying this strategy, PSE
21		typically established plans to purchase hedges for specific forward time periods,

1	with the goal of purchasing a defined amount of power and of gas in order to
2	ratably reduce the deficit positions by a small amount each month.
3	By Spring 2003, the EMC approved expansion of this concept to an "Exposure-
4	based Dollar Cost Averaging." This refinement moved the Company from defining
5	a specific commodity and volume to be hedged every month to a dollar amount of
6	risk reduction to be accomplished every month. Under this approach, the EMC
7	would approve a dollar figure of risk to be reduced, and PSE staff would determine
8	whether it was better to hedge gas or power. As markets moved up or down, the
9	dollar amount would allow for less or greater volumetric purchases.
10	During PCA Period 2, the Company began to employ a metric called Margin at
11	Risk ("MaR"), which measures risk reduction as a result of incremental hedging.
12	See Exhibit No. (DEM-4C). PSE has incorporated the MaR concept into the
13	evaluation process for hedge strategies to measure risk reduction for various
14	alternatives. A series of hedge strategies (transaction types) are run through the
15	portfolio, providing a table of how much risk reduction is gained by month and by
16	strategy. The MaR concept assists with deciding how to allocate dollars in a credit-
17	constrained environment, thus providing an additional tool for choosing between
18	available commodities. See Exhibit No. (DEM-7C).
19	In July 2004, the EMC approved a continuation of a dollar cost averaging strategy
20	informed by MaR. However, the EMC directed that PSE staff monitor and more
21	actively address the exposure associated with PSE's power portfolio position
	Prefiled Direct Testimony Exhibit No. (DEM-1CT)

1		months ahead of the time the power would be needed. Under this Rolling
2		-Month Hedging Plan, EPM staff more actively manage the next rolling
3		months beyond their -month ( ) purview. This hedging plan increased
4		staff's ability to react to position changes as a result of forecast customer demand,
5		stream-flow variations, forced thermal plant outages, and changing market
6		conditions. See Exhibit No. (DEM-4C).
7	Q.	How does the RollingMonth Hedging Plan work?
8	A.	The plan is set up to systematically reduce the total net exposure for each month of
9		the months beyond the <b>constant</b> timeframe, within maximum and minimum
10		limits on the amount of hedging that can or must be done each month, so that the
11		total net exposure for a month will fall within existing exposure limits when each
12		month falls into EPM staff's
13		The maximum monthly hedge is calculated by dividing the total net exposure by the
14		remaining months before the position enters the <b>month</b> purview. The minimum
15		monthly hedge is calculated by dividing the total net exposure – minus the
16		Director's limit authority (\$7 million) – by the remaining months before the
17		position enters the <b>constant</b> month purview. For example, in <b>constant</b> the total net
18		exposure for July 2006 was approximately -\$10 million. With months remaining
19		before July 2006 fell into staff's month purview, the maximum reduction in
20		exposure to be undertaken by EPM staff would be
21		, and the minimum reduction in exposure to be undertaken by staff would
	(Cont	ed Direct Testimony fidential) of E. Mills E. Mills Exhibit No. (DEM-1CT) Page 15 of 23

1		be <b>Example 1</b> be addition, EPM staff review
2		market fundamentals, hydro conditions, and other available information as well as
3		the MaR analysis to determine which commodity to hedge (and for which month
4		given a credit constrained environment) and whether to hedge to the minimum or
5		maximum exposure reduction level (or somewhere in between).
6		Additional illustration of the application of the Rolling Month Hedging Plan and
7		PSE's other risk management tools and systems are provided in Exhibit
8		No(DEM-3C).
9	Q.	Has the Company addressed long-term hedging issues?
10	A.	Yes. These efforts have taken place on a number of fronts, including through:
11		analysis conducted for the Company's Least Cost Plan (filed with the Commission
12		on May 2, 2005); building PSE's modeling capabilities; surveying customer
13		preferences with respect to price volatility and hedging costs; benchmarking of best
14		practices by other utilities; assessing the amount of credit available to PSE to
15		engage in longer-term hedging; and engaging in long-term market fundamental
16		analysis.
17	Q.	Does the Company plan to make any changes to its power hedging strategy?
18	A.	Yes. The Company is planning to extend the term of the power hedging strategy
19		from to months as well as to augment the active position management period
20		from the first <b>m</b> months to the first <b>m</b> months. The revised strategy will retain
	(Conf	ed Direct Testimony     REDACTED     Exhibit No. (DEM-1CT)       idential) of     VERSION     Page 16 of 23

1	many of the same featu	res as the existing hedgi	ing strategy. These include:		
2	(i) A required ratable reduction of monthly commodity exposure is				
3	removed	l each month;			
4	(ii) The volu	ume of monthly hedging	and intra-month timing for hedging		
5	is inform	ned by market fundamer	ntals; and		
6	(iii) Hedging	targets are established	on the basis of the minimum or		
7	maximum amount of commodity exposure allowed under the				
8	Compan	y's Procedures Manual.			
9	The revised plan requires that on or before <b>months</b> ahead of delivery, the				
10	bulk of the hedging strategies and transactions have been made per this				
11	programmatic plan. Beyond the <b>sector</b> months just prior to delivery, the revised				
12	strategy employs a "Rolling -Month Hedging Plan", making the cumulative term				
13	a total of months.				
14	These revisions will enable the Company to monitor and more actively address the				
15	exposure associated with PSE's power portfolio position <b>months</b> ahead of the				
16	time the power would be needed to serve load, thus enabling staff to more actively				
17	manage the next rolling months.

#### 2. <u>Application of PSE's Risk Management System to PCA Period 5</u> <u>Power Costs</u>

# Q. Would you please provide some examples of how PSE applied the risk management systems, tools and strategies described above with respect to PCA Period 5 power supply and costs?

6 Yes, I would be pleased to. Take, for example, PSE's energy requirements for July A. 7 PSE's short-term risk management team began to 2006. Beginning in 8 actively reduce spot market price exposure for the delivery period July 2006. From 9 through , on a monthly or bi-monthly basis, EPM staff 10 developed strategies to reduce PSE's exposure with respect to its electric supply 11 needs for July 2006. Such strategies were based on updated Position and Exposure 12 Reports generated by KW3000, market heat rates, hydro conditions and weather 13 fundamentals, and other available information. In accordance with the EMC 14 approved Rolling Month Hedging Plan and within the limits described in PSE's 15 Procedures Manual, PSE staff executed these strategies by entering into hedging 16 transactions. EPM staff can make recommendations to depart from this plan, but 17 execution of such hedges are subject to EMC approval. With respect to July 2006 power supply, EPM staff did not make any such recommendations, but instead, kept 18 19 the EMC informed of its analyses and activities.

Beginning in **Constraints**, July 2006 rolled into Staff's **Constraints** purview,
allowing Staff to more actively manage the position by responding to short-term
market fundamentals. Staff analyzed PSE's position for July 2006 on a monthly or

1		bi-monthly basis and, based on market conditions and other information available to		
2		them at the time, took actions to reduce PSE's exposure under the authority and		
3		limits of the Procedures Manual.		
4		Documenting the details of these activities requires extensive description and		
5		explanation of the information and reports used by the Company at each stage of its		
6		consideration, decision making, and execution of PSE's risk management strategies.		
7		Thus, this description and documentation is separately presented in my Exhibit		
8		No(DEM-3C).		
9	0	Are the estivities described in Exhibit No. $(DEM 3C)$ the only risk		
	Q.	Are the activities described in Exhibit No(DEM-3C) the only risk		
10		management activities that PSE undertook for PCA Period 5?		
11	A.	No, similar activities were undertaken with respect to managing PSE's portfolio		
12		and exposure for the entire PCA Period 5. Some of that information is evident from		
13		the materials presented in Exhibit No. (DEM-3C) and the other exhibits		
14		presented with my testimony. However, describing and documenting all of the		
15		details of such activities for the entire PCA Period 5 would be a monumental task.		
16	Q.	How did the Company manage gas supply for Tenaska during PCA Period 5?		
17	A.	The Company managed gas supply for Tenaska as part of its overall power		
18		portfolio by applying the risk management tools and systems described above. The		
19		Company ultimately hedged the financial exposure associated with its power		
20		portfolio taking into account the probabilistic dispatch rate of the Tenaska and other
