4 **DAVID J. LANDERS**

5 **I. CUSTOMER GROWTH AND SERVICE NEEDS**

6 **A. Overview**

7 **Q. Please briefly describe Puget Sound Energy’s (“PSE”) customer growth and**  
8 **new service investments presented in this case.**

9 A. PSE responds to typically 15,000 to 17,000 incoming requests annually from  
10 customers, builders, and contractors for new service connections to homes and  
11 businesses, including the extension of gas mains and electric lines as needed. A  
12 key activity that drives investments is also the need to address load in an area that  
13 is increasing through the collective addition of new or modified services such that  
14 the mains and feeders reach their capacity limit and must be upgraded to provide  
15 adequate service, pressure, and voltage, to all customers. In addition to increasing  
16 load, PSE is continuing to see an increase in customer-side distributed energy  
17 resources which when integrated can provide supply support. Distributed energy  
18 resources are forecasted to increase and in addition to planning for their load  
19 impacts, PSE is proactively planning to maintain grid capability to leverage  
20 benefits of this two-way power flow.

1 **Q. Please provide PSE’s planned customer growth and new service capital**  
2 **investments over the rate period presented in this case.**

3 A. Table 1 provides the planned capital investments from January 1, 2025 through  
4 December 31, 2026, which are estimated based on historic trends and  
5 programmatic plans. Gas investments have been adjusted based on the current  
6 tariff, Gas Rule 06 (Extension of Distribution Facilities), which has and will  
7 continue to reduce the margin allowance, requiring the customer to pay a larger  
8 proportion of the actual cost of new or modified services. PSE anticipates fewer  
9 new customers at the end of the rate plan and an increasing number of retirements  
10 into the future. PSE anticipates increased investment in the capacity of the electric  
11 system as new load continues to increase and less customers use gas to meet their  
12 energy needs. The capacity of the pipeline system will likely support the  
13 additional gas customer load over the next few years and therefore there are no  
14 pipeline capacity investments envisioned except where there are current reliability  
15 deficiencies. This assumes characteristics of the system and supply remain the  
16 same.

17 **Table 1: Summary of total customer growth and service needs capital**  
18 **investments by year.**

<b>Customer growth and service needs (\$ Millions)</b>	<b>Rate Plan Year 1 2025</b>	<b>Rate Plan Year 2 2026</b>
Electric Capital investment	104.1	120.6
Gas Capital investment	33.6	18.5

1 Additionally, there is incremental operations and maintenance (“O&M”) related  
2 to capital investment (“OMRC”) associated with the above investments that totals  
3 about \$3.7 million over the two-year period.

4 **Q. Please describe cost controls employed to efficiently deploy capital**  
5 **investments.**

6 A. The cost controls deployed by PSE for investments follows the general approach  
7 discussed in the Prefiled Direct Testimony of Roque B. Bamba, Exh. RBB-1T. A  
8 project manager is assigned who manages the project from inception through  
9 closeout, driving the schedule, managing budgets, and coordinating construction  
10 and design activities and milestones with both internal and external team  
11 members. Additional cost controls exist through fixed unitized pricing from  
12 established construction contracts.

13 **B. Equity**

14 **Q. Please describe how PSE has considered equity in responding to customer**  
15 **requests and relevant investments.**

16 A. While PSE has little control regarding the location of the customer requests or  
17 where capacity constraints result from growing load, PSE recognizes that  
18 decisions in how PSE responds to customer requests or prioritizes actions can  
19 advance energy equity. There are several business functions in which  
20 incorporating equity into decisions has or is being considered:

- 21 • PSE considers equity when faced with material shortages. Supply chain  
22 constraints have become more frequent since disruptions of the COVID-  
23 19 pandemic and PSE is taking into account customer requests that are

1 associated with vulnerable communities when allocating material that is in  
2 short supply. An example is when PSE experienced a J-Box shortage  
3 during the COVID-19 pandemic and screened for equity indicators such as  
4 health and wellness, low income housing, and jurisdictional projects, in  
5 managing project delays.

- 6 • PSE is expanding awareness of the vulnerabilities of communities from  
7 which customers are requesting service in order to consider construction,  
8 service priority, outage concerns, or capacity solution options that help to  
9 relieve burdens where possible. PSE field, planning, and engineering  
10 employees have access to GIS maps that include identification of highly  
11 impacted communities and vulnerable populations and this information  
12 and its usability will continue to improve. That said, a challenge is that  
13 PSE often deals with developers/property managers that may not provide  
14 adequate information for a full understanding of specific end use  
15 customers, or customer groups that will be the eventual customer, or that  
16 are contracting to agencies.
- 17 • PSE maintains a document that identifies the pros and cons as well as  
18 maturity and cost of distributed energy resources to guide customer and  
19 developer decision making. PSE is updating this document and tool to  
20 incorporate equity benefits for planners to leverage as the pace of adoption  
21 of distributed energy resources increases.
- 22 • PSE has developed a circuit planning tool that provides an initial view of  
23 performance, health, seasonal loading, ratings, phasing, overloading,  
24 voltage, electric vehicle forecasts, generation, and equity for planners to  
25 identify which circuits require study for development of capacity and  
26 reliability solution proposals. PSE can use this tool to identify where  
27 carrying capacity could be increased through distributed energy resource  
28 options relieving burdens on the Delivery System and to named  
29 communities through avoided disruption from construction activities and  
30 operations, and utilization of distributed energy resources as a local  
31 resource. In addition, the tool allows PSE to identify named communities  
32 to engage with to understand consequences of existing or future system  
33 performance, recognizing that system performance data provides a sense of  
34 availability, not consequences which may be different for named  
35 communities than other communities.
- 36 • PSE's investments in backbone Delivery System infrastructure to meet  
37 customer capacity and reliability needs incorporate equity through the  
38 Investment Decision Optimization Tool ("iDOT"), ensuring a targeted  
39 percentage of the investment occurs in named communities for  
40 distributional justice. Following guidance and input from the Equity  
41 Advisory Group in 2023, capacity and reliability project investments  
42 developed for the years covered in this rate plan were selected to meet or

1 exceed a threshold for thirty percent of investments to provide an equity  
2 benefit to highly impacted communities.

3 • Additionally, analysis used in determining non-wire / pipe alternatives  
4 considers equity in the process of determining final solution and capacity  
5 investments are optimized through iDOT which has incorporated equity  
6 alongside the benefit to cost analysis.

7 • PSE's project execution team is typically responsible for determining  
8 whether the system must be shut down to complete project construction  
9 (i.e., planned outage) for all capacity, customer, and reliability projects.  
10 While planned outages are dictated by safety and the system's  
11 configuration and ability to shift load, in the future, PSE will consider  
12 impact on named communities which may influence scheduled time of day  
13 or duration of planned outages.

14 **C. Customer Requests**

15 **Q. Please describe PSE's customer requested investments and core objectives  
16 and priorities.**

17 A. In response to customers requesting new or modified loads, PSE installs new or  
18 upgraded service lines to the requested homes and building locations. In some  
19 cases, the existing Delivery System electrical circuit lines or gas mains are  
20 extended or upgraded to accommodate the request or additional load. Also  
21 included, in accordance with tariffs, are contributions by customers where they  
22 are required to pay for all or a portion of these costs, or contributions in aid of  
23 construction ("CIAC") dollars. While customer requested investments take  
24 priority over discretionary work so customer service expectations are met, not  
25 every customer request proceeds to plant being installed and sometimes the plant  
26 is put in service in a future year from when the request was made. For larger  
27 projects, this can spread capital expenses over multiple years. PSE is also seeing  
28 an increase in property redevelopment where existing houses are being

1 demolished and new, often larger, homes are constructed. This creates incoming  
2 work but does not increase the number of PSE customers. This makes it difficult  
3 to equate investments in a given year with new customers added. These  
4 investments are supported by the Corporate Spending Authorization (“CSA”) –  
5 Customer Construction Gas and Electric provided in Appendix A. PSE CSAs  
6 provide project background, statement of need, scope, benefits, cost estimate,  
7 alternatives, and funding risk.

8 **Q. Please provide PSE’s planned customer requested capital investments over**  
9 **the rate period presented in this case.**

10 A. Table 2 provides the planned capital investments from January 1, 2025 through  
11 December 31, 2026, which are estimated based on historic trends and forecasted  
12 customer growth. Investments are net of any CIAC dollars, which may be  
13 required as a condition of service as described in PSE’s tariffs.

14 **Table 2: Summary of customer requests capital investments by year.**

<b>Customer requests</b>	<b>Rate Plan Year 1 2025</b>	<b>Rate Plan Year 2 2026</b>
Electric Capital investment (\$ Millions)	73.4	75.5
Electric Customer plant in service orders (#)	19,000 to 20,000 annually	
Gas Capital investment (\$ Millions)	33.6	18.5
Gas Customer plant in service orders (#)	8,500 to 9,500 annually	

1 Additionally, there is incremental OMRC associated with the above rate periods  
2 of about \$2.2 million.

3 **Q. With gas line extension margin allowances reducing to zero by January 1,**  
4 **2025, why are capital investments still planned for gas customer requests?**

5 A. Per the Settlement Stipulation and Agreement on Revenue Requirement and All  
6 Other Issues Except Tacoma LNG and Green Direct in PSE's 2022 General Rate  
7 Case,<sup>1</sup> PSE agreed to reduce natural gas line extension margin allowances to a  
8 two-year net present value ("NPV") timeframe beginning July 1, 2023 in  
9 alignment with the effective date of new state building codes, further reduce  
10 margin allowances to a one-year NPV timeframe effective January 1, 2024, and  
11 eliminate the margin allowance effective January 1, 2025.

12 Although the margin allowance for new service applications will end on January  
13 1, 2025, elapsed time between receipt of completed customer applications and  
14 placement of new customer load into service will result in continued investment  
15 in line extensions during this multiyear rate plan. These investments will diminish  
16 to zero after five years have elapsed, the amount of time for new customer load to  
17 be placed in service per PSE Natural Gas Tariff Rule No. 6,<sup>2</sup> and become fully  
18 covered by customer-paid CIAC.

---

<sup>1</sup> *WUTC v. Puget Sound Energy*, Dockets UE-220066/UG-220067 et al., Settlement Stipulation and Agreement on Revenue Requirement and All Other Issues Except Tacoma LNG and PSE's Green Direct Program, at 26 (Dec. 22, 2022).

<sup>2</sup> [https://www.pse.com/-/media/Project/PSE/Portal/Rate-documents/Gas2/gas\\_rule\\_06\\_line.pdf?rev=d1b9c3ee109a4d2c8f53e1079951df90&sc\\_lang=en](https://www.pse.com/-/media/Project/PSE/Portal/Rate-documents/Gas2/gas_rule_06_line.pdf?rev=d1b9c3ee109a4d2c8f53e1079951df90&sc_lang=en).

1 **Q. Please describe the work completed and anticipated through the end of the**  
2 **rate plan.**

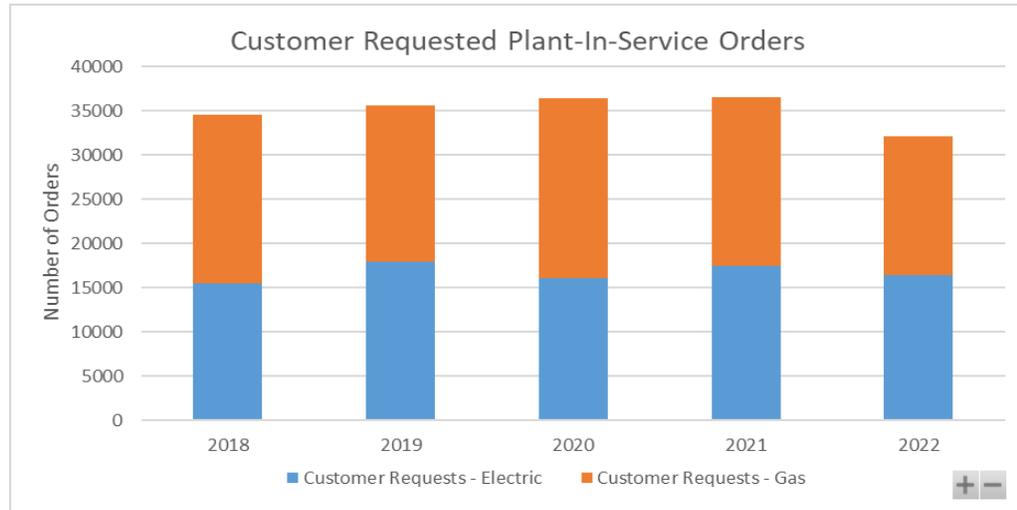

3 A. PSE anticipates addressing approximately 82,000 electric customer work orders  
4 and 35,000 gas customer work orders from January 1, 2025 through December  
5 31, 2026. PSE does a large volume of work for existing customers. These  
6 numbers include work that alters/modifies services for existing customers. Many  
7 customer projects require multiple work orders as well.

8 **Q. Please describe the basis for the forecasted customer requested investments**  
9 **in more detail.**

10 A. The annual funding level is re-forecasted each year with the new corporate load  
11 forecast which varies as a result of econometric analysis, codes, standards, and  
12 other dynamic impacts to these short cycle investments. Under the multiyear rate  
13 plan, this means other planned investments may need to be adjusted annually  
14 since customer requests are not discretionary. As such, these investments are also  
15 not ranked against the evaluation criteria in the iDOT planning model. Forecasts  
16 include the margin allowance under both electric and gas tariffs that are applied as  
17 a credit against the cost of the project. Figure 3 provides the customer requests  
18 trend since 2018.

1

**Figure 1: Customer request plant in service orders (2018-2022).**

2

3

4 **Q. Please describe cost controls employed to efficiently deploy capital**  
5 **investments.**

6 A. The cost controls deployed by PSE for investments follows the general approach  
7 discussed in the Prefiled Direct Testimony of Roque B. Bamba, Exh. RBB-1T. A  
8 project manager is assigned who manages the project from inception through  
9 closeout, driving the schedule, managing budgets, and coordinating construction  
10 and design activities and milestones with both internal and external team  
11 members. Additional cost controls exist through fixed unitized pricing from  
12 established construction contracts.

13 **Q. Please describe customer benefits of customer requested investments.**

14 A. Individual customers benefit from the availability of electric and gas service  
15 through a regulated service provider. All system customers benefit from  
16 economies of scale that customer growth provides. For example, the vast majority  
17 of delivery service costs (both electric and gas) are fixed in nature. System growth

1 costs are spread across all customers so as customer growth increases, the cost per  
2 customer decreases.

3 **Q. Please describe the performance metrics that these investments impact.**

4 A. These investments predominately impact the following corporate performance  
5 metrics based on performing the work with customer satisfaction in mind:

- 6 • SQI #10 – Percent of service appointments kept; and
- 7 • SQI #2 – Complaints to the WUTC per 1,000 customers.

8 Additionally, Delivery System upgrades performed as part of fulfilling the  
9 customer requested work often includes removing older plant and installing new  
10 facilities which is accompanied by improved reliability benefits:

- 11 • SQI #3 – SAIDI
- 12 • SQI #4 – SAIFI

13 **Q. Are there O&M cost reductions that are expected to result from these**  
14 **program investments?**

15 A. No. These investments serve customers, which marginally increases O&M  
16 expense associated with increased maintenance for additional infrastructure and  
17 customers.

1 **D. Capacity**

2 **Q. Please describe PSE's capacity investments and core objectives and**  
3 **priorities.**

4 A. Capacity investments are targeted at maintaining service quality and ensuring a  
5 safe, reliable, and available Delivery System for new customer connections,  
6 especially as loads grow and load types evolve. For PSE's pipeline systems, more  
7 or larger pipes are required to remain within required performance standards, such  
8 as maintaining adequate gas pressure. For PSE's electric system, more or larger  
9 wires are required to remain within required performance standards (such as  
10 power quality), serve new, growing, and forecasted loads, or increase hosting  
11 capacity to enable distributed energy resources. All of these investments help  
12 customer appliances and equipment work correctly.

13 The core objective of the capacity investments is to prevent utility or customer  
14 equipment from being damaged or failing due to poor power quality or gas  
15 pressure. Capacity investments address broad system load increases in a proactive  
16 and planned manner. Prioritization of capacity investments avoids delays related  
17 to necessary but unplanned system upgrades needed to fulfill new customer  
18 service requests. Capacity investments are planned several years in advance of  
19 need. As mentioned above, PSE anticipates increasing electric capacity  
20 investments to meet growing electric load. Electric distribution planned work is  
21 supported by the Targeted Capacity Upgrades business plan, provided in  
22 Appendix B.

1 As discussed above, capacity investments can also be made to enable or add  
2 customer-side of meter or utility-scale distributed energy resources to enhance  
3 distribution or transmission load-supporting capacity in lieu of making traditional  
4 wire investments. This work is supported by the CSA – Grid Modernization: DER  
5 Circuit Enablement and the DER and Microgrids Business Plan provided in  
6 Appendix C. The business plan provides background, statement of need, plan  
7 detail and scope, benefits, cost estimates, alternatives, and funding risks.

8 PSE is not currently investing in pipeline capacity projects to address future or  
9 growing needs. Any investments that increase pipeline capacity are to maintain  
10 reliability for serving customer demand. Please reference Exh. DJL-6 for more  
11 information.

12 **Q. Please provide PSE’s planned capacity capital investments over the rate**  
13 **period presented in this case.**

14 A. Table 3 provides the planned capital investments from January 1, 2025 through  
15 December 31, 2026. These are estimated based on plans developed from  
16 modeling load growth forecasts and trended system needs. PSE’s pipeline  
17 investments currently only address load that cannot be served today without  
18 manual, real-time field adjustments. These pipeline investments address reliability  
19 concerns and are discussed in Exh. DJL-6.

20 **Table 3: Summary of electric capacity investments by year.**

Electric capacity	Rate Plan Year 1 2025	Rate Plan Year 2 2026
Targeted Capacity Capital investment (\$ Millions)	25.2	20.2
Projects (#)	5	10

DER enablement Capital investment (\$ Millions)	5.5	24.9
Projects (#)	1	11

1 Additionally, there is incremental OMRC associated with the above rate periods  
2 of about \$1.5 million.

3 **Q. Please describe the work anticipated through the end of the rate plan.**

4 A. Targeted capacity investments address ongoing and emerging capacity needs  
5 across PSE’s entire population of distribution circuits. With the Clean Energy  
6 Transformation Act (CETA)<sup>3</sup> signed into law in 2019 and changes in energy  
7 codes, customer electric loads are increasing as buildings, homes, and  
8 transportation shift toward carbon-free resources. Growth is seen across the  
9 service territory: from industrial additions of electric vehicle battery testing  
10 facilities in Whatcom County, to commercial installations of electric vehicle  
11 charging stations in retail parking lots, and electric-only, multi-home plat  
12 developments in King County. To meet these evolving demands, this investment  
13 focuses on installing, upgrading, and replacing assets and infrastructure to  
14 distribute safe, clean, and reliable electric energy. During the rate plan, PSE  
15 anticipates completing 15 targeted capacity projects, representing approximately  
16 1.4 percent of PSE’s distribution circuits.

17 Distributed energy resource enablement investments create more opportunities for  
18 customers seeking to interconnect distributed energy resources or form

---

<sup>3</sup> Chapter 19.405 RCW.

1 microgrids. These customers include developers, commercial facilities, residential  
2 installations, and named communities. Key tasks to achieve circuit enablement for  
3 distributed energy resources and microgrids include:

- 4 • Upsizing of assets such as conductors and service transformers to  
5 accommodate additional renewable energy capacity.
- 6 • Adding line capacitors, regulators, and/or substation transformer upgrades  
7 for voltage regulation.
- 8 • Adding reclosers and protective relays.
- 9 • Substation upgrades such as smart circuit breakers, 115 kV circuit  
10 switchers, or communications to protect the system from higher fault  
11 currents.
- 12 • Improving communication networks for granular loading data.

13 During the rate plan, PSE anticipates completing 12 electric distribution projects  
14 to facilitate the enablement of distributed energy resources.

15 **Q. Please describe the basis for the forecasted capacity investments in more**  
16 **detail.**

17 A. Forecasted funding is developed through the Delivery System Planning process  
18 and evaluating system performance with increasing loads, as discussed in my  
19 Prefiled Direct Testimony, Exh. DJL-1T. Solution costs are estimated using tools  
20 provided by PSE's Project Delivery organization, based on historical average  
21 costs. Forecasted funding is a combination of known planned projects  
22 supplemented by the historic programmatic trend of these types of investments.  
23 Between 2018 and 2022, the number of circuits that exceeded 85 percent  
24 utilization, based upon summer peak loading, increased from 20 to 41. This trend

1 indicates the impacts of growing load through economic shifts, electrification, and  
2 decarbonization, and is in-line with spatial forecasting through LoadSEER.

3 Moving forward, PSE will continue to utilize forecasting data to improve the  
4 Delivery System to allow capacity for new loads and operational flexibility, a key  
5 requirement for maintaining reliability.

6 Additionally supporting the ability to meet growth of electrical load on the  
7 Delivery System is distributed energy resource acquisition. Upon completion of  
8 its 2023 Distributed Solar and Storage Request for Proposals (DSS RFP), PSE is  
9 forecasting the acquisition of 22 photovoltaic, six battery, and three hybrid  
10 distribution interconnected projects by the end of 2025. The total AC nameplate  
11 of these projects will add a combined 52.0 megawatts of solar and 32.9 megawatts  
12 of battery capacity integrated into and benefiting the Delivery System. Six  
13 Community Solar projects are in the design stage with ongoing lease negotiations  
14 totaling 0.82 MW. Two additional projects at PSE sites are in design stage only  
15 and total 0.658 MW.

16 **Q. Please describe cost controls employed to efficiently deploy capital**  
17 **investments.**

18 A. The cost controls deployed by PSE for these investments follows the general  
19 program management approach discussed by Roque Bamba in Exh. RBB-1T.

20 **Q. Please describe the benefits of the capacity investments.**

21 A. The primary benefit of capacity investments is the ability to serve load and to  
22 provide operational flexibility for temporary service restoration while the cause of

1 an outage is remediated. If capacity concerns are left unaddressed, the increased  
2 energy load will overload equipment resulting in energy quality concerns or even  
3 dropped load due to equipment failure. Table 4 provides a summary of the  
4 avoided unserved energy (load at risk of being served) that will be addressed by  
5 these investments.

6 **Table 4: Summary of capacity investments benefits by year.**

Type of benefit	Rate Plan Year 1 2025	Rate Plan Year 2 2026
Unserved Energy (MWh)	2,207	1,984
DER Hosting Capacity Enabled (MW)	12.9	19.7
T&D Investment deferred (\$ millions)	39.5	60.5

7 **Q. Please describe the performance metrics that these investments impact.**

8 A. These investments generally impact the SAIDI and SAIFI corporate performance  
9 metrics by avoiding outage restoration delays caused by lack of capacity for  
10 operational flexibility. The following SAIDI and SAIFI metrics will be impacted  
11 if PSE fails to address capacity constraints:

- 12 • SQI #3 – SAIDI
- 13 • SQI #4 – SAIFI

14 **Q. Are there anticipated O&M cost reductions that are expected to result from  
15 these program investments?**

16 A. No. As discussed above, these investments are made to afford new customers  
17 access to electricity and avoid outages not accounted for in current O&M expense  
18 plans.

1 **II. CONCLUSION**

2 **Q. Does this conclude your testimony?**

3 **A. Yes, it does.**
