1           i.           SUMMARY OF PROFESSIONAL EXPERTISE AND QUALIFICATIONS

2   **Q.       PLEASE STATE YOUR NAME, AFFILIATION, AND CURRENT BUSINESS**  
3   **ADDRESS.**

4   A.       My name is Michael R. Baranowski. I am employed by FTI Consulting as a  
5       Senior Managing Director. My business address is 1201 I Street, NW, Suite 400,  
6       Washington, D.C. 20005.

7   **Q.       PLEASE SUMMARIZE YOUR QUALIFICATIONS.**

8   A.       I am Senior Managing Director of the Network Industries Strategies group of FTI  
9       Consulting, Inc. and am principally responsible for all aspects of the Network  
10       Industries Strategies telecommunications practice as well as for major segments  
11       of its railroad and other network industries practices.

12       For the past seven years, I have been heavily involved in quantitative analyses of  
13       telecommunications issues arising out of the passage of the Telecommunications  
14       Act of 1996. I have sponsored TELRIC-based cost studies, or otherwise testified  
15       on the development of TELRIC costs, in UNE pricing proceedings in virtually all  
16       of the states within the Verizon footprint and before the Federal Communications  
17       Commission. In the course of that work, I have become familiar with virtually  
18       every TELRIC cost model advocated by both ILECs and CLECs, and have also  
19       reviewed numerous cost studies that were allegedly based upon the ILECs'  
20       existing network configurations. I am thoroughly familiar with the issues raised in  
21       the Federal Communications Commission's Triennial Review Order ("TRO") as

1 they relate to the need for business case analyses to determine if competitors can  
2 economically serve markets without access to certain unbundled network  
3 elements.

4 I also have experience with other network industries. I have nearly 20 years of  
5 experience consulting to the nation's major railroads and petroleum products  
6 pipelines on a variety of issues, including economic and financial studies of  
7 pricing, costing, and mergers and acquisitions.

8 II. INTRODUCTION, PURPOSE, AND STRUCTURE OF TESTIMONY

9 Q. **WHAT IS THE PURPOSE OF YOUR TESTIMONY?**

10 A. The purpose of my testimony is to present the results of AT&T's Business Case  
11 Analysis Tool ("BCAT") that is used to demonstrate the economic impairment  
12 that would be suffered by an efficient CLEC providing service to mass market  
13 consumers in Washington if unbundled switching is unavailable. My testimony  
14 provides an overview of the BCAT, certain key assumptions, and an analysis of  
15 the results. The BCAT is relevant to the assessment of potential competition and  
16 is consistent with the FCC's recent Triennial Review Order ("TRO")<sup>1</sup> and the

---

<sup>1</sup> *Report and Order and Order on Remand and Further Notice of Proposed Rulemaking*, In the Matter of Review of the Section 251 Unbundling Obligations of Incumbent Local Exchange Carriers, Federal Communications Commission, CC Docket No. 01-338, (Released August 21, 2003.) ("TRO")

1 economic and regulatory framework for assessing impairment as explained in the  
2 testimony of Drs. William Lehr and Lee Selwyn.<sup>2</sup>

3 **Q. PLEASE SUMMARIZE THE MAIN CONCLUSIONS YOU REACH IN YOUR**  
4 **TESTIMONY.**

5 **A.** The principal conclusions that are explained in my testimony include the  
6 following:

7 (1) Efficient CLEC entry to serve mass market customers in Washington would be  
8 unprofitable without access to unbundled switching. A CLEC should expect to  
9 realize large negative returns if it attempted to execute the efficient business plan.

10 (2) The BCAT provides a conservative estimate of the likely economic losses  
11 associated with seeking to serve mass market consumers without unbundled  
12 switching in Washington. Actual losses would likely be larger.

13 (3) The BCAT model uses the best available, verifiable data in its formulation. This  
14 includes relying on granular, Washington-specific inputs wherever possible. This  
15 is consistent with the TRO and its proper application as explained in Drs. Lehr  
16 and Selwyn's testimony.

---

<sup>2</sup> See *Direct Testimony of William H. Lehr and Lee L. Selwyn on Behalf of AT&T*, In the matter of the Petition of Qwest Corporation To Initiate a Mass-Market Switching And Dedicated Transport Case Pursuant to the Triennial Review Order, Before the Washington Utilities and Transportation Commission, Docket No. UT-033044, December 22, 2003 (hereafter, referred to as "Testimony of Drs. Lehr and Selwyn").

1 Q. HOW IS THE REST OF YOUR TESTIMONY ORGANIZED?

2 A. The balance of my testimony is organized into the following three sections:

3 Section III provides an overview of the BCAT and summarizes the main results;

4 Section IV provides a more detailed discussion of the business case for potential

5 CLEC competition that demonstrates impairment in the absence of unbundled

6 switching for mass market customers; Section V is the conclusion.

7 **III. OVERVIEW OF THE BUSINESS CASE ANALYSIS TOOL (BCAT)**

8 A. **Summary Description of BCAT and Results**

9 Q. PLEASE EXPLAIN WHAT THE BCAT IS INTENDED TO DO.

10 A. The BCAT presents the business case for an efficient CLEC seeking to provide  
11 telephone services to mass market customers without access to unbundled  
12 switching. The model assumes that the efficient CLEC will serve mass market  
13 customers located in every wire center in each of the three LATAs in  
14 Washington.<sup>3</sup> The BCAT computes the net present value of the business plan for  
15 an efficient CLEC using UNE-L and CLEC-owned switching to serve mass  
16 market customers in Washington. This represents the profit-maximizing, or  
17 equivalently, the least-cost strategy for serving these customers if unbundled  
18 switching is not available.

19

---

<sup>3</sup> Qwest provides service in LATA-672, 674 and 676 in Washington. Most of LATA-672 is in Oregon. The analysis of profitability is presented for each LATA separately.

1 Q. CAN YOU SUMMARIZE THE MAIN FINDINGS OF THE BCAT ANALYSIS?

2 A. Yes. Table 1 summarizes the key results of the BCAT analysis. As is clear from  
3 the results in the table, an efficient CLEC using UNE-L and its own switch could  
4 expect to earn significant negative returns, i.e., would lose money, ranging from  
5 \$188.39 to \$303.76 per mass market line served in Washington.

6 Table 1: Profitability of CLEC UNE-L Entry in Washington  
7 (Summary)  
8 (\$/Year/Customer DS0 Line)

**Results Including Long Distance**

	LATA-672c	LATA-674	LATA-676
Revenues	\$ 338.22	\$ 340.74	\$ 340.69
Costs	\$ 588.04	\$ 529.13	\$ 644.45
<b>Operating Margin</b>	<b>\$ (249.82)</b>	<b>\$ (188.39)</b>	<b>\$ (303.76)</b>

**Results Excluding Long Distance**

	LATA-672c	LATA-674	LATA-676
Revenues	\$ 285.24	\$ 287.13	\$ 287.09
Costs	\$ 563.09	\$ 504.10	\$ 619.42
<b>Operating Margin</b>	<b>\$ (277.85)</b>	<b>\$ (216.97)</b>	<b>\$ (332.33)</b>

9

10 Furthermore, because the BCAT employs conservative assumptions, these results  
11 understate costs and overstate revenues, and therefore, understate the impairment  
12 a CLEC would suffer without unbundled switching.

13 B. Structure of the BCAT

14 Q. HOW DOES THE BCAT COMPUTE THE VALUES IN TABLE 1?

15 A. The BCAT calculates the revenues earned and the capital and operating costs  
16 associated with serving mass market customers for each year in the ten year

1 planning horizon. These dollar values are converted to present value dollars using  
2 an appropriate discount factor and are then levelized to produce a uniform average  
3 amount per line per year over the study period.<sup>4</sup> Table 1 summarizes the results in  
4 a margin computation format that shows the average expected profitability  
5 expected from the mass market.

6 **Q. PLEASE EXPLAIN HOW THE BCAT IS STRUCTURED AND ITS KEY**  
7 **COMPONENTS.**

8 A. The BCAT is a spreadsheet that extends the computations and analysis in the DS0  
9 Impairment Cost Tool ("DS0 Impairment Tool"), which is described in the  
10 testimony of Denney/Starr.<sup>5</sup> The DS0 Impairment Tool includes: (1) information  
11 to forecast CLEC demand; (2) network cost information; and (3) operating cost  
12 information. This information is handed off to the BCAT which adds revenue  
13 forecast information.

14 As explained in the testimony of Denney/Starr, the CLEC demand forecast  
15 assumes that the CLEC ultimately will capture a 5 percent share of mass market  
16 end-user lines in each wire center. This demand forecast is used to optimally site  
17 and size CLEC switching, collocation, and backhaul facilities (*i.e.*, the transport  
18 and interconnection facilities used to connect ILEC provided UNE-L loops to  
19 CLEC switches).

---

<sup>4</sup> This levelization summarizes the impact of changes over time.

<sup>5</sup> See *Direct Testimony of Denney/Starr on Behalf of AT&T*, In the matter of the Petition of Qwest Corporation To Initiate a Mass-Market Switching And Dedicated Transport Case Pursuant to the Triennial Review Order, Before the Washington Utilities and Transportation Commission, Docket No. UT-033044, December 22, 2003.

1 The DS0 Impairment Tool develops both the forecast of CLEC demand (in terms  
2 of mass market end user lines served in each wire center in each year) and the  
3 costs associated with providing the backhaul network that connects UNE-L loops  
4 to the CLEC switch (which includes the cost of "hot cuts"). As explained further  
5 below, the DS0 Impairment Tool assumes a conservative allocation of shared  
6 costs between enterprise and mass market consumers. This tends to understate the  
7 impairment associated with serving mass market consumers.

8 The operating cost information included in the BCAT computes additional  
9 network and non-network capital and operating costs associated with serving  
10 mass market consumers. These include the cost of installing and operating the  
11 CLEC switch. The non-network related operating costs include elements to  
12 account for the retail and other back-office costs associated with running the  
13 CLEC's mass market business. These include costs for customer care, billing and  
14 collections, and general administration. When combined with the backhaul costs  
15 from the DS0 Impairment Tool, the BCAT computes the total capital and  
16 operating costs that an efficient CLEC would incur in serving mass market  
17 customers.

18 The revenue information is the final component of the BCAT. The revenue  
19 information calculates the expected revenue to be realized from serving mass  
20 market customers. This includes forecasts for all of the relevant sources of  
21 wholesale (*e.g.*, access and reciprocal compensation) and retail revenues (*e.g.*,

1 local access, ancillary services, vertical features, and long distance) that a CLEC  
2 could reasonably expect to earn from serving its mass market customers.

3 **C. How BCAT Ensures CLEC Costs Are Minimized**

4 **Q. HOW DOES THE BCAT ENSURE THAT THE ESTIMATED COSTS OF CLEC**  
5 **ENTRY ARE MINIMIZED?**

6 A. The BCAT presents the business plan for an efficient CLEC. By appropriately  
7 scaling its market entry to encompass a wide geographic area, by seeking to serve  
8 both enterprise and mass market consumers, and by offering a bundle of value-  
9 added services in conjunction with basic telephone service, the BCAT assumes  
10 that the CLEC will take advantage of available scale and scope economies.

11 Additionally, the BCAT assumes that the CLEC will optimally employ the best-  
12 available technologies and will efficiently site and size its facilities in order to  
13 minimize CLEC capital and operating costs while providing service to mass  
14 market customers throughout the LATA (*i.e.*, in each wire center).

15 The BCAT assumes a ten year planning horizon, and optimally allocates  
16 investment in network and retail/marketing costs to efficiently match the growth  
17 in the CLEC's customer base.

18 Finally, the BCAT uses conservative assumptions that understate the costs that  
19 would be realized in serving mass market customers in Washington.

1 Q. WHAT ASSUMPTION DOES THE BCAT MAKE REGARDING THE MARKET  
2 TO BE SERVED?

3 A. The BCAT is based on the assumption that the efficient CLEC will serve both  
4 enterprise and mass market consumers, and that the mass market customers will  
5 include both small business and residential customers. Additionally, the BCAT  
6 assumes that mass market customers will purchase a bundle of services that  
7 includes basic telephone service, vertical features, ancillary services,<sup>6</sup> and long  
8 distance service. These modeling decisions ensure that the BCAT analyses  
9 incorporates the benefits of available scale and scope economies.

10 Q. PLEASE EXPLAIN WHY THE BUSINESS MODEL ASSUMES THAT THE CLEC  
11 WILL SELL TO BOTH ENTERPRISE AND MASS MARKET CUSTOMERS.

12 A. As the testimony of Drs. Lehr and Selwyn explains, neither the TRO nor the Act  
13 specify a preference for what ought to constitute the CLEC business case for  
14 assessing impairment, beyond that it should be an efficient (*i.e.*, cost-minimizing,  
15 profit-maximizing) business plan.

16 The BCAT assumes the CLEC will serve both enterprise and mass market  
17 customers because the costs involved in serving mass market customers on a  
18 stand-alone basis (*i.e.*, without also serving enterprise customers) would certainly  
19 be greater. The BCAT enables CLEC switching and transport costs to be shared  
20 among its enterprise and mass market customers, thereby reducing the cost per  
21 line for serving mass market customers.

---

<sup>6</sup> For example, maintenance for inside wiring.

1 **D. Why BCAT Impairment Analysis is Conservative**

2 **Q. PLEASE EXPLAIN WHY THE BCAT RESULTS ARE CONSERVATIVE WITH**  
3 **RESPECT TO DEMONSTRATING IMPAIRMENT.**

4 A. As I use the term "conservative" here and throughout my testimony, I mean that  
5 costs tend to be understated and mass market revenues to be overstated such that  
6 the likelihood of a finding of impairment is reduced. The BCAT is conservative  
7 because it tends to understate costs and tends to overstate mass market revenues.  
8 Taken together, this results in an overstatement in expected profitability in the  
9 base case.

10 The BCAT results are conservative with respect to demonstrating impairment for  
11 several reasons. First, they understate network-related costs because they  
12 implicitly assume higher network utilization rates than are likely to be achievable  
13 in practice. Second, they understate non-network operating costs because they  
14 rely on ILEC cost data that reflects scale and scope economies that an individual  
15 CLEC is unlikely to realize. Third, the BCAT revenue module likely overstates  
16 the revenues because it does not fully reflect the impact of post-entry competition  
17 on retail pricing.

1 Q. PLEASE EXPLAIN HOW THE BCAT'S NETWORK UTILIZATION  
2 ASSUMPTION IS CONSERVATIVE.

3 A. As explained in the DS0 Impairment Tool testimony, network costs are likely to  
4 be understated because they rely on aggressive assumptions regarding the  
5 expected efficiency (network utilization) of the network used to serve enterprise  
6 customers. The DS0 Impairment Tool designs and sizes the backhaul network to  
7 efficiently serve mass market customers and assumes all excess capacity of the  
8 CLEC's local network is used to serve enterprise customers. This allows the mass  
9 market business to realize scale and scope efficiencies that are unlikely to be  
10 realized in practice.

11 Q. PLEASE EXPLAIN HOW THE BCAT'S ESTIMATES OF NON-NETWORK  
12 OPERATING COSTS ARE CONSERVATIVE.

13 A. The BCAT computes several of the elements that comprise non-network  
14 operating costs using ARMIS data on expenditures incurred by the ILECs. This  
15 includes the estimates of customer billing, customer care, and general  
16 administration expenses. These reflect scale and scope economies that are not  
17 attainable by a CLEC, which cannot expect to match the customer base served by  
18 the incumbent in the foreseeable future. Additionally, the BCAT does not include  
19 estimates of the cost of establishing a brand image.

20 Finally, the BCAT uses a conservative estimate of customer acquisition costs that  
21 is comparable to the customer acquisition costs incurred by the incumbent, even  
22 though the CLEC faces the more onerous burden of attracting mass market

1 customers away from the ILEC. Therefore, the customer acquisition costs faced  
2 by a CLEC are likely to be higher than assumed in the BCAT analysis.

3 **Q. PLEASE EXPLAIN HOW THE BCAT'S REVENUE FORECAST IS**  
4 **CONSERVATIVE.**

5 A. The BCAT forecast of CLEC revenue is conservative because it understates the  
6 likely impact of post-entry competition on retail prices. The BCAT revenue  
7 module makes only a modest adjustment to reflect the impact of post-entry  
8 competition on retail revenues. ILEC costs are largely sunk or fixed, and retail  
9 rates for the most profitable services (*e.g.*, vertical services and access) are  
10 significantly above forward-looking incremental costs. If ILECs respond to CLEC  
11 entry by reducing their prices for these highly profitable service components,  
12 retail prices will be much lower than forecasted in the model.

13 **E. The Role of Long Distance on the Impairment Analysis**

14 **Q. SHOULD LONG DISTANCE REVENUES BE EXCLUDED FROM THE**  
15 **IMPAIRMENT ANALYSIS?**

16 A. As a matter of logic, yes. I believe it would be appropriate to exclude long  
17 distance revenues from the impairment analysis for two reasons: *first*, to ensure  
18 symmetric treatment when analyzing ILEC and CLEC businesses, and *second*,  
19 because most potential CLEC competitors do not have a long distance facilities-  
20 based network.

1 Q. PLEASE EXPLAIN WHY EXCLUSION OF LONG DISTANCE REVENUES IS  
2 APPROPRIATE TO ENSURE SYMMETRIC TREATMENT OF ILEC AND CLEC  
3 BUSINESSES.

4 A. ILECs in Washington – including both Qwest and Verizon – are subject to  
5 traditional rate of return (“ROR”) type regulation. The determination of an  
6 ILEC’s “revenue requirement” under ROR regulation currently excludes the  
7 revenues and costs associated with ILEC long distance affiliates, such as Qwest  
8 Long Distance (“QLD”) and Verizon Long Distance (“VLD”). The only portion  
9 of the affiliates’ long distance revenues that is incorporated into the ILEC revenue  
10 requirement comes from the “payment” of access charges by the long distance  
11 affiliate to the ILEC. The long distance affiliates also make nominal “payments”  
12 to the ILEC entities for certain services that are furnished to them by the ILEC,  
13 such as marketing and customer acquisition, billing and collection, and various  
14 other administrative services. The profit that is nominally carried on the  
15 affiliates’ books (after having made the various transfer payments to the ILECs) is  
16 *excluded* from consideration with respect to the ILEC entities’ revenue  
17 requirement and rate level.

18 However, the ILEC long distance affiliates are heavily dependent upon ILEC  
19 services and resources; indeed, for most purposes, the long distance affiliates and

1 the ILECs are *de facto* integrated, and indeed can be formally integrated once the  
2 Sec. 272(a) separate [long distance] affiliate sunsets.<sup>7</sup>

3 The profits that an ILEC long distance affiliate earns contribute to the ILEC's  
4 overall profit margins. Therefore, if long distance revenues are included in the  
5 CLEC's business plan but excluded from regulatory decisions regarding the ILEC,  
6 this will tend to understate the relative impairment faced by a CLEC when  
7 competing against the incumbent. Hence, unless ILEC long distance revenues are  
8 included in analyses of the profitability of ILEC services, it would be  
9 inappropriate to include long distance revenues when considering the profitability  
10 of CLEC business plans.

11 **Q. WHAT IS THE IMPACT OF THE FACT THAT MOST POTENTIAL CLECS DO**  
12 **NOT HAVE A FACILITIES-BASED LONG DISTANCE NETWORK?**

13 **A.** As noted earlier and in the testimony of Drs. Lehr and Selwyn, neither the Act nor  
14 the TRO seeks to limit CLEC competition to CLECs with a single business  
15 model. Most potential CLECs are *not* facilities-based interexchange carriers that  
16 already own a long-haul network. These CLECs, if they elected to provide long  
17 distance services, would need to acquire and resell the services of a facilities-  
18 based long distance carrier. In that event, a portion of the potential margin (in  
19 excess of access charge payments) that might be derived from the provision of

---

<sup>7</sup> 47 U.S.C. § 272(f)(1).

1 retail long distance service would have to, in effect, be “shared” with the  
2 facilities-based carrier.

3 Finally, even if the CLEC has its own facilities-based long distance network, it  
4 could certainly adopt a corporate structure in which the long distance operations  
5 are placed in a separate affiliate that purchases access and other services from the  
6 CLEC. Clearly, the inclusion or exclusion of long distance revenues should be  
7 done on a consistent basis for all LECs (ILECs and CLECs) in determining the  
8 relative impairment CLECs face with respect to ILECs, and whatever basis is  
9 adopted should be independent of the carriers’ corporate structures.

10 **Q. DOES THE BCAT ANALYSIS INCLUDE LONG DISTANCE REVENUES?**

11 **A.** Yes. Even though I believe long distance revenues could reasonably be excluded  
12 from the analysis, I recognize that the TRO (§519) states that such revenues (and  
13 associated costs) should be included in the business case considered by state  
14 commissions. Accordingly, I have summarized the results of the BCAT analysis  
15 in Table 1 with long distance revenues included and excluded. The results  
16 demonstrate that the inclusion of long distance revenues (and associated costs)  
17 does not reverse the finding of impairment with respect to mass market switching.

1 F. **Additional Discussion of BCAT Modeling Features and Assumptions**

2 Q. **PLEASE EXPLAIN IN GENERAL TERMS WHY THE BCAT ASSUMES THAT**  
3 **THE CLEC WILL HAVE AT LEAST TWO SWITCHES INTERCONNECTED BY**  
4 **A FIBER RING.**

5 A. Customers of basic telephone service are accustomed to an extremely high-level  
6 of reliability and availability. Relying on two switches provides the minimal  
7 amount of physical redundancy necessary to ensure that the CLEC can deliver  
8 reliable service. Connecting these two switches via a fiber ring provides  
9 redundancy in transport and an efficient platform for interconnecting the CLEC  
10 collocation facilities located in the ILEC wire centers across the state.

11 The backhaul network is designed and sized to optimally take advantage of the  
12 best available technology, so as to minimize the costs of providing back-haul. A  
13 more detailed discussion of the network design assumptions that underlie the  
14 BCAT's analysis is included in the testimony of Robert Falcone<sup>8</sup> and  
15 Denney/Starr.

---

<sup>8</sup> See *Direct Testimony of Robert Falcone on Behalf of AT&T*, In the matter of the Petition of Qwest Corporation To Initiate a Mass-Market Switching And Dedicated Transport Case Pursuant to the Triennial Review Order, Before the Washington Utilities and Transportation Commission, Docket No. UT-033044, December 22, 2003.

1 Q. PLEASE EXPLAIN HOW THE DS0 IMPAIRMENT TOOL AND BCAT ARE  
2 RELATED.

3 A. The DS0 Impairment Tool provides key inputs to the BCAT and therefore it is  
4 closely coupled to the BCAT. Both rely on a consistent set of assumptions. The  
5 DS0 Impairment Tool computes the average cost per line to backhaul voice grade  
6 loops from various ILEC wire centers to the CLEC switch. This average cost per  
7 line and certain of the parameters used to develop the cost are direct inputs to the  
8 BCAT. These include:

- 9 (1) Cost of capital;  
10 (2) Annual cost factors and expense to investment ratios for switch  
11 and circuit equipment;  
12 (3) Annual mass market and enterprise voice-grade equivalent  
13 lines, including annual mass market connects and disconnects;  
14 (4) Weighted miles to the closest tandem; and,  
15 (5) Cost per DS3 between nodes.

16 In addition, because the DS0 Impairment Tool develops the backhaul cost on a  
17 “per line per month basis” for each wire center in Washington, the output is used  
18 as a mechanism for aggregating other cost information needed for the BCAT.  
19 Specifically, an adjunct to the DS0 Impairment Tool was created that appends to  
20 the DS0 wire center specific output information for the appropriate UNE loop  
21 rates charged by the incumbent, the average residential and business revenue per  
22 line, as well as the applicable SLC charges and average USF withdrawal (to the

1 extent they occur). These fields are aggregated along with the backhaul cost on a  
2 per line basis for use within the BCAT.

3 **Q. PLEASE EXPLAIN HOW THE BCAT ESTIMATES CLEC SWITCHING COSTS.**

4 **A.** There are two components to CLEC switching costs. First, there is the fixed cost  
5 associated with purchasing and installing a switch. Second, there are the variable  
6 costs that increase with the number of end-user lines served by the switch. The  
7 BCAT uses estimates of both of these costs that were derived via a linear  
8 regression analysis of switching investment that was used by the FCC in the  
9 development of its Synthesis Cost Model for estimating the cost of providing  
10 Universal Service.<sup>9</sup>

11 **IV. ANALYSIS OF RESULTS**

12 **Q. PLEASE PROVIDE A MORE DETAILED ANALYSIS OF THE REVENUES AND**  
13 **COSTS ASSOCIATED WITH THE BCAT ANALYSIS OF IMPAIRMENT.**

14 **A.** Table 2 provides a more detailed presentation of the BCAT analysis of the  
15 margins that an efficient CLEC would expect to earn if it provided service to mass  
16 market customers in Washington via UNE-L and CLEC-owned switching.

17 Table 2 separates annual CLEC revenues per line into revenues associated with  
18 (R1) providing basic telephone service; (R2) vertical features; (R3) access  
19 revenues; (R4) ancillary revenues; and (R5) long distance revenues.

---

<sup>9</sup> See, Tenth Report and Order, Federal Communications Commission, CC Docket Nos. 96-45, 97-160, FCC 99-304, October 21, 1999 (“Inputs Order”), ¶307-308.

1 Table 2 separates annual CLEC costs per line into costs associated with (C1)  
2 access and settlement payments;<sup>10</sup> (C2) back-haul costs computed by the DS0  
3 Impairment Tool; (C3) Other network-related capital and operating costs  
4 (including switching costs); (C4) UNE-L loop related costs; and, (C5) Non-  
5 network-related costs.

6 The questions and answers following Table 2 provide additional detail regarding  
7 where the information in Table 2 comes from.

8

---

<sup>10</sup> These are associated with providing long distance services and are excluded when long distance service revenues are excluded.

1 **Table 2: Profitability of CLEC UNE-L Entry in Washington (Detail)**

2 **(\$/Year/Customer DS0 Line)**

**Results Including Long Distance**

	LATA-672c	LATA-674	LATA-676
<b>Revenues</b>			
Basic	\$ 263.18	\$ 264.77	\$ 264.74
Access	9.22	9.31	9.31
Long Distance	61.01	61.72	61.70
Ancillary	4.81	4.94	4.94
Subtotal Revenues	\$ 338.22	\$ 340.74	\$ 340.69

1     **A.     Revenue Elements Discussed**

2     **Q.     PLEASE EXPLAIN HOW THE REVENUES ASSOCIATED WITH PROVIDING**  
3     **BASIC TELEPHONE SERVICE ARE COMPUTED IN TABLE 2.**

4     **A.**     The revenues associated with providing basic telephone service are composed of  
5     several rate elements. These include the ILEC tariffed rate for basic telephone  
6     service, the Subscriber Line Charge (“SLC”), and the average receipts from the  
7     Universal Service Fund (“USF”).

8     To estimate the basic telephone service rates, the BCAT maps incumbent  
9     exchange rate zones to wire centers to determine the applicable rate for basic  
10    telephone service (with a separate mapping for business and residential  
11    customers). These are aggregated and averaged to determine the appropriate  
12    revenue per line for basic telephone service for a mass market consumer in each  
13    LATA during the initial year.

14    The SLC and USF withdrawals are estimated by customer and business class of  
15    service. They may also differ depending upon whether a single line or multiple  
16    lines are used by the customer. Accordingly, the BCAT relies upon a state-  
17    specific table of charges to compute these rate elements. If both a state and an  
18    interstate SLC are applicable, the two are added together.

1 Q. HOW ARE REVENUES ASSOCIATED WITH VERTICAL FEATURES  
2 COMPUTED IN TABLE 2?

3 A. The revenue associated with vertical features is estimated from a sample of  
4 residential customer bills referred to as the "TNS Telecoms Bill Harvest."<sup>11</sup> The  
5 BCAT uses TNS data from customer bills from the third quarter of 2002 through  
6 the second quarter of 2003, which are the most recent available year of data. The  
7 feature revenue reflects both the explicit feature revenue on the bills as well as the  
8 implicit feature revenue that is part of bundles. Because the TNS data reflects a  
9 representative customer sample, it accounts for the fact that not all residential  
10 customers purchase vertical features, and those that do, do not all purchase the  
11 same bundle of features.

12 To be conservative, the estimate for residential customers is also used for small  
13 business customers, although a recent analyst report suggests that commercial  
14 business vertical feature revenue per line is lower.<sup>12</sup>

15 Q. HOW DOES THE BCAT ESTIMATE ACCESS REVENUES?

16 A. Access revenues are calculated using the access minutes, by jurisdiction, that  
17 were generated previously in sizing the local network. The BCAT employs four  
18 rate estimates, *i.e.*, intrastate originating, intrastate terminating, interstate  
19 originating, and interstate terminating. Each of these rates is multiplied by a price

---

<sup>11</sup> TNS Telecoms, Jenkintown, PA, one year accumulation of the results from the quarterly TNS Telecoms Bill Harvest product (3Q02 to 2Q03) for the bills of consumers who reside in the footprint of Qwest WA.

<sup>12</sup> JP Morgan November 7, 2003 North American Equity Research Report U.S. Telecommunications, The Art of War, page 12.

1 index to permit price trends to be incorporated. The incumbent access rates are  
2 the benchmark for the CLEC pricing.<sup>13</sup>

3 **Q. PLEASE EXPLAIN HOW THE BCAT ESTIMATES LONG DISTANCE**  
4 **REVENUES.**

5 A. Like the feature revenue, the LD revenue for consumers is estimated from the  
6 TNS Telecoms Bill Harvest product. This revenue reflects both the retail toll  
7 revenue where Qwest is the retail provider as well as where an IXC is the retail  
8 provider. Retail Long Distance (LD) revenues are input as an aggregate category  
9 into the BCAT, however the corresponding minutes are subdivided into four  
10 categories: intraLATA intrastate, interLATA intrastate, interLATA interstate, and  
11 international. The disaggregation of minutes into these categories is necessary to  
12 consistently compute access charges and settlements costs. The BCAT also  
13 provides for an adjustment of the unit long distance revenue over time.

14 **Q. DOES THE BCAT ASSUME THAT TODAY'S RATES WILL REMAIN IN**  
15 **EFFECT INDEFINITELY?**

16 A. No. Rates were adjusted based on observed recent rate trends in the price index  
17 for residential local service, intrastate toll and interstate toll.<sup>14</sup> This is  
18 conservative since the impact of CLEC competition has been limited in the past  
19 and competition for value-added vertical features and long distance is likely to

---

<sup>13</sup> Because of the dominant position of the incumbent, the CLEC is assumed to be the price "taker" for switched access pricing.

<sup>14</sup> See Trends in Telephone Service, Table 12.3, p 12-5.

1 intensify. In any case, the BCAT allows price trends for different services to be  
2 adjusted.

3 **Q. PLEASE EXPLAIN HOW THE BCAT ESTIMATES ANCILLARY**  
4 **REVENUES.**

5 A. Ancillary revenues are revenues attributable to the provision of voice mail  
6 services and revenues from inside wire maintenance. Like long distance  
7 revenues, they are estimated on a per line basis from the TNS Telecoms Bill  
8 Harvest product.

9 **B. Cost Elements Discussed**

10 **Q. HOW ARE CLEC PAYMENTS TO OTHER CARRIERS QUANTIFIED?**

11 A. Access costs for terminating intrastate and interstate traffic are calculated using  
12 terminated access minutes, by jurisdiction, that were generated previously in  
13 sizing the local network. The BCAT employs two rate estimates, *i.e.*, intrastate  
14 terminating and interstate terminating. Each of these rates is multiplied by a price  
15 index to permit price trends to be incorporated. Reciprocal Compensation would  
16 be treated in a similar manner, however, Washington operates under bill and keep  
17 arrangements.

1 **Q. HOW ARE COSTS ASSOCIATED WITH THE CLEC TERMINATING**  
2 **USAGE FOR OTHER CARRIERS DEVELOPED?**

3 The access usage and local usage terminated for other LECs (as well as on-net  
4 retail local usage)<sup>15</sup> are considered in sizing the local switch trunks and in the  
5 sizing and the apportioning of the local switch costs (to the extent minutes are a  
6 relevant cost driver). Thus, there is no need to separately quantify local network  
7 costs. These costs are found in "Switching and Other Network Costs" and are  
8 offset by the access and reciprocal compensation revenues received from other  
9 carriers.

10 **Q. HOW ARE THE LD NETWORK COSTS ESTIMATED FOR THE CLEC**  
11 **WHERE IT PROVIDES END-TO-END LD?**

12 To the extent that an efficient CLEC also provides end-to-end long distance  
13 services, the BCAT must include the cost of the non-local network. Rather than  
14 undertaking a simulation of a national LD network, a "per minute" estimate of the  
15 costs are included based on non-proprietary data sources.<sup>16</sup> The results computed

---

<sup>15</sup> The traffic handled by the CLEC will include local traffic that originates and terminates on to CLEC local service customers ("on-net" usage) as well as traffic that originates from (or terminates to) end-user lines served by the CLEC but terminates to (originates from) end-user lines served by the ILEC or another CLEC. This latter traffic is "off-net." The BCAT estimates both "on-net" and "off-net" usage.

<sup>16</sup> The national terminating access expense is from FCC SOCC (11/10/03) Table 2.12, p106, All Reporting Company Traffic Sensitive Access divided by associated Switched Traffic Sensitive Minutes (premium and non-premium) from FCC SOCC Table 2.17, p111. Calculation is \$2,746.2M divided by (392,162.565 premium TS access minutes + 3.124M) and is as of the end of 2002. Network costs are derived from Bank of America Securities, Research Brief-Wireline Telecommunications, AT&T Corporation, A Case for Consumer Services (\$846M, \$601M and \$500M for 2000 through 2002, respectively) divided by consumer conversation minutes from Credit Suisse/First Boston, AT&T Consumer: A Base Case Ahead of the Triennial Review (93.8B, 82.2B and 70.5B, for 200 through 2003, respectively). The average network costs for the period is \$0.0090, \$0.0073, and \$0.0070, per conversation minute for 2000 through 2002, respectively.

1 for each year are levelized based on the lines in service for each year. The  
2 assumption here is that the CLEC will lease its LD network capacity from a  
3 wholesaler that has an in-place LD network and that the charges will approximate  
4 the costs. This “buy-by-the-minute” approach is generally what the incumbents  
5 have done to establish long distance networking capabilities following 271 relief.

6 **Q. PLEASE DESCRIBE HOW THE BCAT DEVELOPS COSTS FOR**  
7 **SETTLEMENTS OF INTERNATIONAL CALLS.**

8 A. Unlike the preceding usage categories, the “network” costs for terminating  
9 international calling is not fully captured in either the local network cost or the  
10 wholesale long distance network costs. As a result, the payments to foreign  
11 carriers must be reflected as a cost for the CLEC if that CLEC provides retail LD  
12 services. This is accomplished by applying an average settlement cost per  
13 minute<sup>17</sup> to the mass-market international minutes that the CLEC serves on a  
14 retail basis. As with the preceding costs, the annual costs are levelized.

15 **Q. HOW ARE THE BACK-HAUL AND HOT-CUT COSTS DETERMINED?**

16 A. The back-haul cost and hot-cut cost are developed within the DS0 Impairment  
17 Tool and are provided as inputs to the BCAT.

---

<sup>17</sup> The settlement amount per minute is calculated by dividing the net settlements amount Trends In Telephone Service, August 2003, Table 6.2 (p.6-4) by the international minutes (Table 6.1, p 6-3).

1 **Q. PLEASE DESCRIBE THE SWITCHING AND OTHER NETWORK**  
2 **OPERATING COSTS.**

3 A. As discussed above, the BCAT develops the investment required for switches to  
4 serve both enterprise and mass market customers. The switching and other  
5 network operating costs reflect the levelized cost of the switches to serve each  
6 LATA and the land and building costs required to accommodate those switches.

7 **Q. HOW ARE THE UNE-L LOOP COSTS DETERMINED?**

8 A. The UNE-L loop costs are based on the UNE rates by density zone currently in  
9 effect in Washington. The rates were matched to each wire center density zone in  
10 the output of the DS0 tool and aggregated for use in the BCAT.

11 **Q. HOW DOES THE BCAT ESTIMATE NON-NETWORK RELATED OPERATING**  
12 **COSTS?**

13 A. As I mentioned earlier, the BCAT relies on ARMIS data of the former RBOCs to  
14 estimate costs for billing and collections, customer care, and general and  
15 administrative expenses.

16 **Q. HOW DOES THE BCAT DEVELOP COSTS ASSOCIATED WITH**  
17 **UNCOLLECTIBLE REVENUE?**

18 A. A portion of customer revenues is never collected by carriers, including the  
19 hypothetical efficient CLEC, because of customer bankruptcy, refusal to pay due  
20 to dispute, or service abandonment. The BCAT incorporates these costs by  
21 applying separate uncollectible rates (percentages) to retail revenues, access

1 revenues and reciprocal compensation revenues. To be conservative, the BCAT  
2 relies on ARMIS data on uncollectibles.

3 V. CONCLUSION

4 **Q. PLEASE SUMMARIZE YOUR TESTIMONY.**

5 A. In order to determine whether an efficient CLEC can profitably serve mass-  
6 market customers in Washington, AT&T developed the Business Case Analysis  
7 Tool (BCAT). The BCAT estimates the total revenues and costs that an efficient  
8 CLEC would expect to incur if it used UNE-L and CLEC-owned switching to  
9 serve mass market customers in each of the three LATAs in Washington.

10 The BCAT relies upon inputs and is consistent with the DS0 Impairment Tool  
11 that is discussed in the testimony of Denney/Starr. The BCAT estimates the  
12 revenues and other costs not considered in the DS0 Impairment Tool that would  
13 be incurred by an efficient CLEC over a ten year planning horizon.

14 The BCAT analysis demonstrates that an efficient CLEC would realize substantial  
15 negative returns in serving the mass market using CLEC-owned switching. This  
16 result is not surprising in light of the significant cost disadvantage demonstrated  
17 by the DS0 Impairment Tool, and confirms the TRO's national finding of  
18 impairment with respect to mass market switching.

19 **Q. DOES THIS CONCLUDE YOUR DIRECT TESTIMONY?**

20 A. Yes.
