RE: *In the Matter of the Petition of Puget Sound Energy, For Approval of a Power Purchase Agreement for Acquisition of Coal Transition Power, as Defined in RCW 80.80.010, and the Recovery of Related Acquisition Costs.*
Docket UE-121373

Dear Mr. King:

In Order 03 of the above referenced docket, the Commission required Puget Sound Energy (PSE or company) to monitor, and report annually, TransAlta's production levels at the Centralia Coal Transition Facility (CCTF). This is PSE's fourth annual compliance report since the company began taking deliveries of power under the Coal Transition Power Purchase Agreement (PPA) with TransAlta in December 2014.

Background

Included as part of PSE's annual compliance report is the amount and source of resupply power¹ which TransAlta used to satisfy its delivery obligations under the PPA when the CCTF was not generating power. The Commission's rationale for such reporting was that it is conceivable that deliveries of resupply power could reach a point where the PPA may be determined to no longer qualify under the terms of RCW 80.04.570.²

¹ The term, "resupply power", refers to deliveries of power under the PPA from sources other than the CCTF.

² Order 03 at ¶ 68 states:

"We need not at this juncture determine definitively the full legal consequences that might flow from these circumstances, if they eventuate. It is better to take a conservative and practical approach than to establish a bright line beyond which the volume of resupply power means the contract between PSE and TransAlta will lose its character as a coal transition power purchase agreement. It is for this reason that we issued Bench Request No. 2, to which PSE responded on December 28, 2012. The confidential information PSE provided in its response shows the Historical Generation of the CCTF in GWs on a quarterly basis from the 1st Quarter of 2008 through the 4th Quarter of 2012, as of the time of the response. These data show that TransAlta's operations of the CCTF are consistently at a level, in all quarters of the year, that would result in all power delivered under the Coal Transition

Figure 1 below compares the CCTF’s total generation with the amount and source of power provided by TransAlta to meet its contractual obligation under the terms of the PPA. The MWh volume increases under the terms of the PPA are shown for both December 2015 and December 2016.

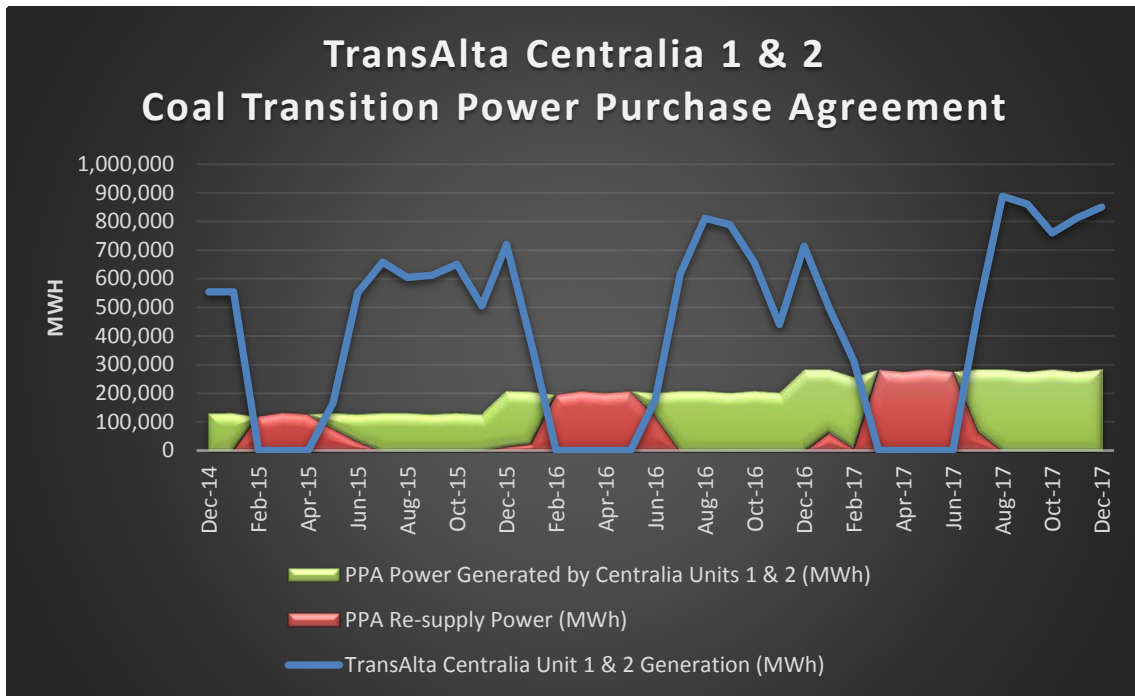

Figure 1 TransAlta Centralia Generation

PSE is also required to report on TransAlta’s “contributions of financial assistance” made pursuant to Section 3 of the Memorandum of Agreement (MOA) between TransAlta and the State of Washington. Under the MOA, each year, three payments are made which sum to \$4,583,333.³ PSE reports that TransAlta has made all of the payments required under the MOA for 2017.

TransAlta also reports annually the average number of full-time equivalent employees (FTEs) employed at the CCTF. For 2017, the number of FTEs employed at the CCTF is 206, the same number of FTEs as last year.

PPA being from the facility. Over the five years reported, had the Coal Transition PPA been in effect, only 10 percent of the deliveries to PSE would have been considered resupply power.”

³ The three separate annual payments are: \$833,333 to the Weatherization Fund; \$1,666,667 to the Economic and Community Development Fund; and \$2,083,333 to the Energy Technology Fund. Payments under the MOA began in 2012 and are scheduled until 2023.

Staff Analysis of PSE’s 2016 Annual Compliance Filing; Coal Transition PPA

CCTF Emissions of CO₂

Emissions from the CCTF continue trending downward as a result of less generation from the plant. At full production (over 90 percent capacity factor and no resupply power) the CCTF’s CO₂ emissions would be about double the 6.6 million tons emitted in 2017.

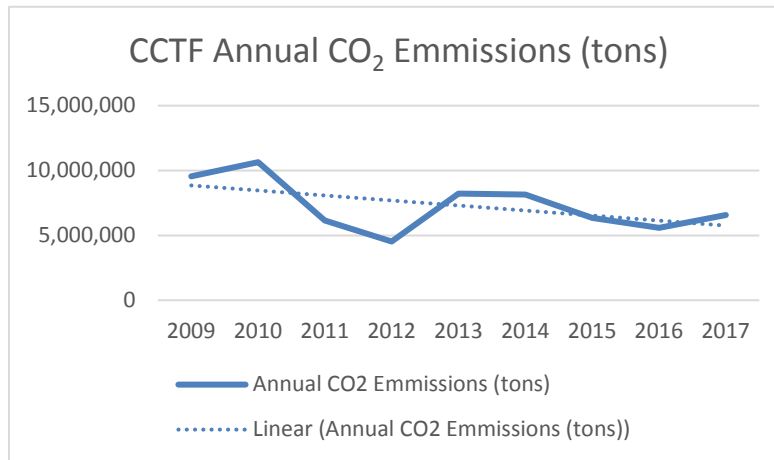

Figure 2; CCTF CO₂ Emissions

Resupply Power

When taking into account total generation for 2017, the CCTF is operating at about half of its total capacity.

CCTF Capacity Factor				
2013	2014	2015	2016	2017
57.2%	56.9%	42.8%	39.0%	46.6%

Resupply as a percentage of total power delivered under the PPA is at about the same level compared to last year. Column a in Table 1 below shows that resupply power totaled 1,256,368 MWh or 37.8 percent of the 3.3 million MWh delivered in 2017. In 2016, resupply power was 962,517 MWh or 38.0 percent of the total 2.5 million MWh delivered under the PPA.

Resupply power amounts are concentrated between the months of February through June when market prices at the MidC trading hub are lower due to hydro generation. The annual compliance report provided by TransAlta also identifies the source of resupply power.⁴ The vast majority of resupply power was generated from hydro resources in 2018.

Staff does not have access to the actual costs and terms by which TransAlta acquired resupply power on the market. Instead, Staff compared PPA prices against average spot market prices for power at the MidC trading hub. Spot prices reflect the cost of energy only and do not include capacity costs or other charges which may be incurred to deliver power to a point of receipt on

⁴ The compliance report from PSE provides the North American Electric Reliability Corporation (NERC) e-Tags for the sources of resupply power.

PSE's system. Therefore, the differential between spot and PPA prices, when applied to resupply volumes, is intended to provide an order of magnitude estimate of the additional margins stemming from TransAlta buying power instead of generating itself at the CCTF.

For 2017, this differential was about \$54.1 million, a \$22 million increase from last year. The increase in the differential was the result of both lower market prices at MidC (compared to 2016) and the volume and price escalations in the PPA.

Coal Transition PPA Power Cost Baseline Impacts

Expressed in terms of PSE's power cost baseline rate, the PPA has the following impacts:

Yr.	Power Cost Baseline Rate	PPA Impact to Baseline Rate	Percent
2015	\$59.819	\$3.742	6.3%
2016	\$59.819	\$5.873	9.8%
2017	\$58.144	\$7.906	13.6%
2018	\$59.841	\$8.045	13.4%

Table 2; Coal Transition PPA Impacts to Power Cost Baseline

As can be seen from Table 2 above, the PPA in its current form constitutes a significant and increasing portion of the power cost baseline rate. Continued decline in market prices for gas and power have helped mitigate the PPA's impacts to the power cost baseline.

Conclusion

For 2017, PSE has complied fully with the reporting requirements contained in Order 3. Staff also concludes that the PPA between PSE and TransAlta continues to meet the legislative policy goals for coal transition power.

"Therefore, it is the purpose of this act to provide for the reduction of greenhouse gas emissions from large coal-fired baseload electric power generation facilities, to effect an orderly transition to cleaner fuels in a manner that ensures reliability of the state's electrical grid, to ensure appropriate cleanup and site restoration upon decommissioning of any of these facilities in the state, and to provide assistance to host communities planning for new economic development and mitigating the economic impacts of the closure of these facilities."

Resupply, in conjunction with lower market prices for power, appear to have allowed TransAlta to economically operate the CCTF at lower capacity thereby reducing emissions from the plant while still meeting its financial obligations to the community.
