"Clean energy by 2045." OK, but it depends on how you define "clean". Nuclear and Hydro are the cleanest. LGN and propane are next. Gas, oil, and coal are third. Solar and wind are dead last, primarily because of the terrible damage they do to the environment, both in manufacture and disposal. Besides, they are inefficient, horribly expensive, unreliable, and not worthy of an industrious society. As long as you get your priorities right, I'm all for clean, reliable, abundant energy.

You need to get the politics out of it and just look at the facts. Those political hacks pushing windmills, solar cells, and unicorns are in it for money and power. They want more-expensive and less-reliable power, to impoverish and enslave the world so they can rule it. Please ignore them and do what's right for the people you serve. Thank you.

Paul Lindberg

ps. There may come a day when solar or wind become technologically stable, less harmful to the environment, and competitive. I hope so. But we are nowhere near that point. And it would be wrong to sell our soul to China to get there.
