Projects like this are incredibly important.

Our region's electricity is generated more than 60% by the use of fossil fuels. That contributes to the local and global warming emergency that is affecting us so drastically with wildfires and flooding and will only get worse. Another block of local energy comes from the dams which are killing off our salmon runs and should be replaced with environmentally sounder sources.

The demand for electricity is going to grow, with shifting preferences towards that energy source in transportation and heating. The new electricity demands, and the existing demands, should be met by cleaner power sources.

Solar PV is a cost effective proven and reliable source of clean energy. When coupled with storage can replace a wide variety of outmoded sources, helping to reduce the threats created by our present destructive sources.

It's a change we owe to our children and theirs.
